DRV880x DMOS Full-Bridge Motor Drivers

1 Features

- H-Bridge Motor Driver
- Low $R_{DS(on)}$ MOSFETs (0.4-Ω Typical)
- Low-Power Sleep Mode
- 100% PWM Supported
- 8-V to 36-V Operating Supply Voltage Range
- Thermally Enhanced Surface-Mount Package
- Protection Features:
  - VBB Undervoltage Lockout (UVLO)
  - Charge Pump Undervoltage (CPUV)
  - Overcurrent Protection (OCP)
  - Short-to-Supply Protection
  - Short-to-Ground Protection
  - Overtemperature Warning (OTW)
  - Overtemperature Shutdown (OTS)
  - Fault Condition Indication Pin (nFAULT)

2 Applications

- Printers
- Industrial Automation
- Robotics

3 Description

The DRV880x provides a versatile motor driver solution with a variety of capabilities. The device contains a full H-bridge which can be used to drive a brushed DC motor, one winding of a stepper motor, or other devices such as solenoids. A simple PHASE-ENABLE interface allows easy interfacing to controller circuits.

The output stages use N-channel power MOSFETs configured as an H-bridge. The DRV880xis capable of peak output currents up to ±2.8 A and operating voltages up to 36 V. An internal charge pump generates the needed gate drive voltages.

A low-power sleep mode is provided which shuts down internal circuitry to achieve a very low quiescent current draw. This sleep mode can be set using a dedicated nSLEEP pin.

Internal protection functions are provided for undervoltage, charge pump fault, overcurrent, short-to-supply, short-to-ground, and overtemperature. Fault conditions are indicated through the nFAULT pin.

The DRV880x is packaged in a 16-pin WQFN package with PowerPAD™ (Eco-friendly: RoHS & no Sb/Br).

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8800	HTSSOP (16)	5.00 mm × 4.40 mm
	WQFN (16)	4.00 mm × 4.00 mm
DRV8801	HTSSOP (16)	5.00 mm × 4.40 mm
	WQFN (16)	4.00 mm × 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Pin Functions

PIN					I/O	DESCRIPTION
NAME	DRV8800		DRV8801			
	WQFN	HTSSOP	WQFN	HTSSOP		
CP1	10	11	10	11	P	Charge pump switching node. Connect a 0.1-µF X7R ceramic capacitor rated for VBB between CP1 and CP2.
CP2	11	12	11	12	P	Charge pump switching node. Connect a 0.1-µF X7R ceramic capacitor rated for VBB between CP1 and CP2.
ENABLE	4	6	4	6	I	Enable logic input. Set high to enable the H-bridge.
GND	2	4	2	4	P	Device ground
MODE	16	2	—	—	I	Mode logic input
MODE 1	—	—	16	2	I	Mode logic input
MODE 2	—	—	5	16	I	Mode 2 logic input
NC	5	16	—	—	NC	No connect
nFAULT	15	1	15	1	OD	Pulled logic low in FAULT condition. Open-drain output requires external pullup.
nSLEEP	3	5	3	5	I	Sleep logic input. Set low to enter low-power sleep mode.
OUT+	6	7	6	7	O	DMOS H-bridge output. Connect to motor terminal.
OUT-	9	10	9	10	O	DMOS H-bridge output. Connect to motor terminal.
PHASE	1	3	1	3	I	WQFN Package: Phase logic input for direction control. HTSSOP Package: Phase logic input. Controls the direction of the H-bridge.
VBB	8	9	8	9	P	Connect to motor power supply. Bypass to ground with 0.1-µF ceramic capacitor and appropriate bulk capacitance rated for VBB.
VCP	13	14	13	14	P	Charge pump output. Connect a 0.1-µF 16-V ceramic capacitor between VCP and VBB.
VREG	14	15	—	—	P	Regulated voltage.
VPROPI	—	—	14	15	O	Voltage output proportional to winding current.
PowerPAD	—	—	—	—	—	Exposed pad for thermal dissipation. Connect to ground.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
VBB	Load supply voltage(2)	–0.3	40	V
	Output current	–2.8	2.8	A
V_{Sense}	Sense voltage	–500	500	mV
	VBB to OUTx		36	V
	OUTx to SENSE		36	V
VDD	Logic input voltage(2)	–0.3	7	V
	Continuous total power dissipation	See *Thermal Information*		
T_A	Operating free-air temperature	–40	85	°C
T_J	Maximum junction temperature		150	°C
T_{stg}	Storage temperature	–40	125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{IN}	Input voltage, VBB	8	32	38	V
T_A	Operating free-air temperature	–40		85	°C

7.4 Thermal Information

THERMAL METRIC(1)		DRV880x		UNIT
		RTY (WQFN)	PWP (HTSSOP)

I_{IH}	PHASE, MODE input current	V_{IN} = 2 V		<1.0	20	µA
I_{IL}		V_{IN} = 0.8 V	–20	≤–2.0	20	
I_{IH}	ENABLE input current	V_{IN} = 2 V		40	100	µA
I_{IL}		V_{IN} = 0.8 V		16	40	
I_{IH}	nSLEEP input current	V_{IN} = 2.7 V		27	50	µA
I_{IL}		V_{IN} = 0.8 V		<1	10	
V_{OL}	nFAULT output voltage	I_{sink} = 1 mA			0.4	V
VBBNFR	VBB nFAULT release	8 V < VBB < 40 V		12	13.8	V
V_{IHys}	Input hysteresis, except nSLEEP		100	500	800	mV
$r_{DS(on)}$	Output ON-resistance	Source driver, I_{OUT} = –2.8 A, T_J = 25°C		0.48		Ω
		Source driver, I_{OUT} = –2.8 A, T_J = 125°C		0.74	0.85	
		Sink driver, I_{OUT} = 2.8 A, T_J = 25°C		0.35		
		Sink driver, I_{OUT} = 2.8 A, T_J = 125°C		0.52	0.7	
VTRP	RSENSE voltage trip	SENSE connected to ground through a 0.2-Ω resistor		500		mV
V_f	Body diode forward voltage	Source diode, I_f = –2.8 A			1.4	V
		Sink diode, I_f = 2.8 A			1.4	
t_{pd}	Propagation delay time	PWM, Change to source or sink ON		600		ns
		PWM, Change to source or sink OFF		100		
t_{COD}	Crossover delay			500		ns
DAGain	Differential AMP gain	Sense = 0.1 V to 0.4 V		5		V/V
PROTECTION CIRCUITRY						
VUV	UVLO threshold	VBB increasing		6.5	7.5	V
I_{OCP}	Overcurrent threshold		3			A
t_{DEG}	Overcurrent deglitch time			3		µs
t_{OCP}	Overcurrent retry time			1.2		ms
TJW	Thermal warning temperature	Temperature increasing (1)		160		°C
TJTSD	Thermal shutdown temperature	Temperature increasing (2)		175		°C

(1) After the device reaches the thermal warning temperature of 160°C, the device will remain in thermal warning until the device cools to 145°C. This is known as the device's thermal warning hysteresis.
(2) After the device reaches the thermal shutdown temperature of 175°C, the device will remain in thermal shutdown until the device cools to 160°C. This is known as the device's thermal shutdown hysteresis.

9 Detailed Description

9.1 Overview

The DRV880x devices are integrated motor driver solutions for brushed DC motors. The devices integrate a DMOS H-bridge, protection circuitry, and simple digital interface. The devices can be powered with a supply voltage between 8 and 36 V and are capable of providing an output current up to 2.8 A.

A PHASE-ENABLE interface allows for easy interfacing to the controller circuit. The PHASE input controls the direction of the H-bridge and the ENABLE input specifies whether the H-bridge is enabled or not.

Two MODE pins allow for specifying which current decay method the device utilizes. MODE1 specifies between fast decay or slow decay and MODE2 specifies between high side or low side slow decay.

The DRV8801 provides the option to monitor the motor winding current through a proportional voltage output.

9.2 Functional Block Diagrams

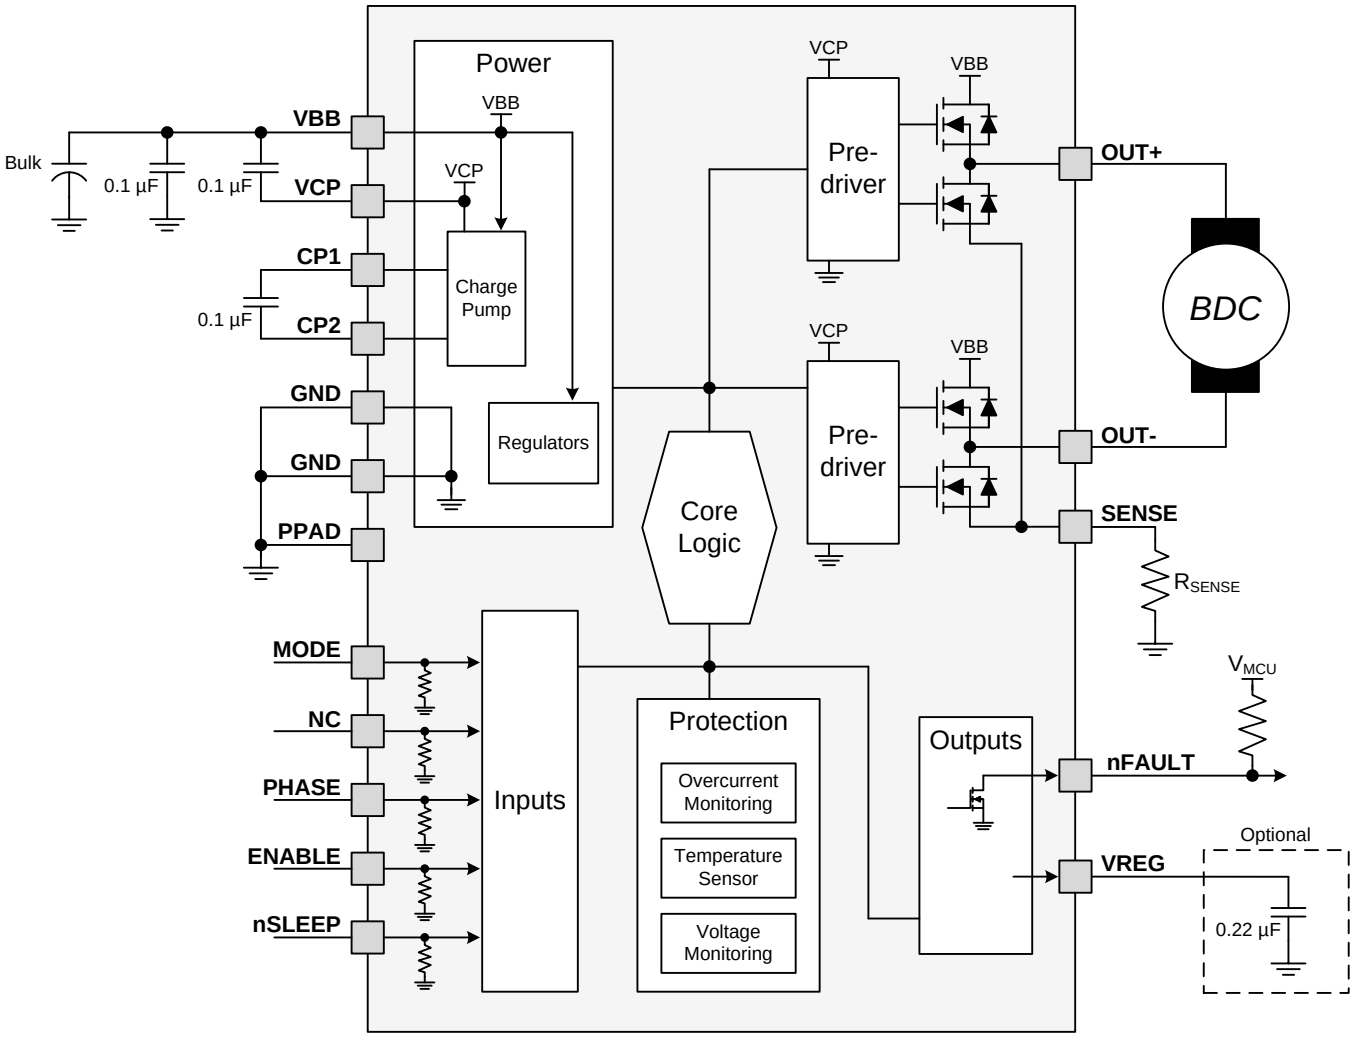

Figure 6. DRV8800 Functional Block Diagram

Functional Block Diagrams (continued)

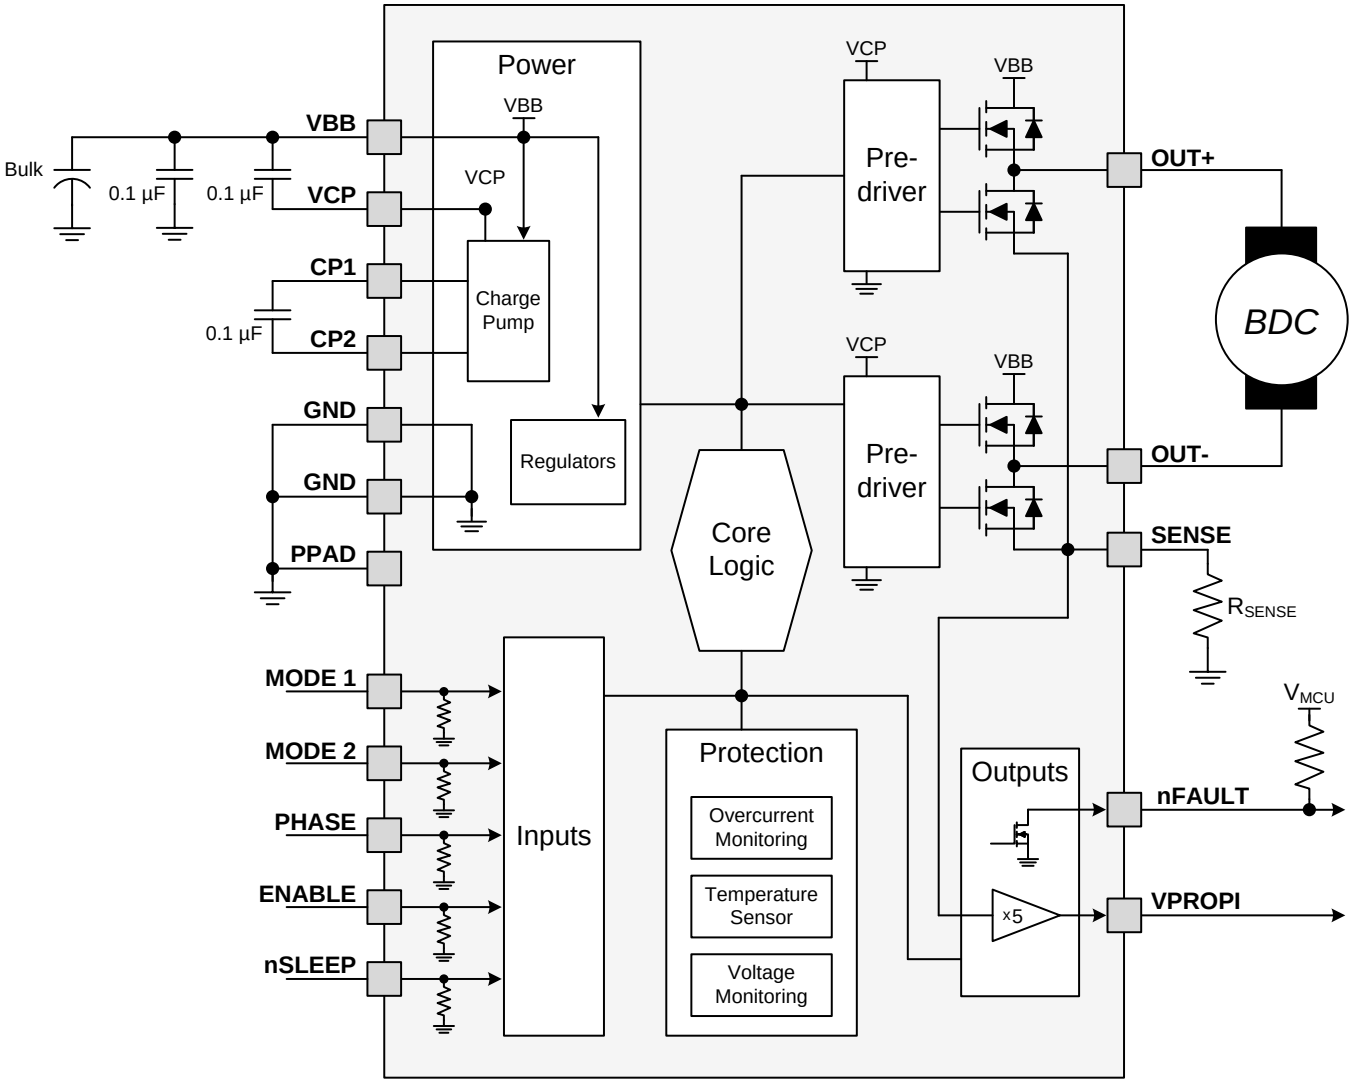

Figure 7. DRV8801 Functional Block Diagram

9.3 Feature Description

9.3.1 Logic Inputs

TI recommends using a high-value pullup resistor when logic inputs are pulled up to V_{DD}. This resistor limits the current to the input in case an overvoltage event occurs. Logic inputs are nSLEEP, MODE, PHASE, and ENABLE. Voltages higher than 7 V on any logic input can cause damage to the input structure.

9.3.2 VREG (DRV8800 Only)

This output represents a measurement of the internal regulator voltage. This pin should be left disconnected. A voltage of approximately 7.5 V can be measured at this pin.

Feature Description (continued)

9.3.3 VPROPI (DRV8801 Only)

This output offers an analog voltage proportional to the winding current. Voltage at this terminal is five times greater than the motor winding current (VPROPI = 5×I). VPROPI is meaningful only if there is a resistor connected to the SENSE pin. If SENSE is connected to ground, VPROPI measures 0 V. During slow decay, VPROPI outputs 0 V. VPROPI can output a maximum of 2.5 V, since at 500 mV on SENSE, the H-bridge is disabled.

9.3.4 Charge Pump

The charge pump is used to generate a supply above VBB to drive the source-side DMOS gates. A 0.1-µF ceramic monolithic capacitor should be connected between CP1 and CP2 for pumping purposes. A 0.1-µF ceramic monolithic capacitor, CStorage, should be connected between VCP and VBB to act as a reservoir to run the high-side DMOS devices. The VCP voltage level is internally monitored and, in the case of a fault condition, the outputs of the device are disabled.

9.3.5 Shutdown

As a measure to protect the device, faults caused by very high junction temperatures or low voltage on VCP disable the outputs of the device until the fault condition is removed. At power on, the UVLO circuit disables the drivers.

9.3.6 Low-Power Mode

Control input nSLEEP is used to minimize power consumption when the DRV880x is not in use. This disables much of the internal circuitry, including the internal voltage rails and charge pump. nSLEEP is asserted low. A logic high on this input pin results in normal operation. When switching from low to high, the user should allow a 1-ms delay before applying PWM signals. This time is needed for the charge pump to stabilize.

- MODE 1 (MODE on the DRV8800)

  Input MODE 1 is used to toggle between fast-decay mode and slow-decay mode. A logic high puts the device in slow-decay mode.
- MODE 2 (DRV8801 only)

  MODE 2 is used to select which set of drivers (high side versus low side) is used during the slow-decay recirculation. MODE 2 is meaningful only when MODE 1 is asserted high. A logic high on MODE 2 has current recirculation through the high-side drivers. A logic low has current recirculation through the low-side drivers.

9.3.7 Braking

The braking function is implemented by driving the device in slow-decay mode (MODE 1 pin is high) and deasserting the enable to low. Because it is possible to drive current in both directions through the DMOS switches, this configuration effectively shorts out the motor-generated BEMF as long as the ENABLE chop mode is asserted. The maximum current can be approximated by VBEMF/RL. Care should be taken to ensure that the maximum ratings of the device are not exceeded in worse-case braking situations – high-speed and high-inertia loads.

9.3.8 Diagnostic Output

The nFAULT pin signals a problem with the chip via an open-drain output. A motor fault, undervoltage condition, or T_J > 160°C drives the pin low. This output is not valid when nSLEEP puts the device into minimum power dissipation mode (that is, nSLEEP is low). nFAULT stays asserted (nFAULT = L) until VBB reaches VBBNFR to give the charge pump headroom to reach its undervoltage threshold. nFAULT is a status-only signal and does not affect any device functionality. The H-bridge portion still operates normally down to VBB = 8 V with nFAULT asserted.

Feature Description (continued)

9.3.9 Thermal Shutdown (TSD)

Two die-temperature monitors are integrated on the chip. As die temperature increases toward the maximum, a thermal warning signal is triggered at 160°C. This fault drives the nFAULT low, but does not disable the operation of the chip. If the die temperature increases further, to approximately 175°C, the full-bridge outputs are disabled until the internal temperature falls below a hysteresis of 15°C.

Table 1. Control Logic Table(1)

PINS							OPERATION
PHASE	ENABLE	MODE 1	MODE 2	nSLEEP	OUT+	OUT-	
1	1	X	X	1	H	L	Forward
0	1	X	X	1	L	H	Reverse
X	0	1	0	1	L	L	Brake (slow decay)
X	0	1	1	1	H	H	Brake (slow decay)
1	0	0	X	1	L	H	Fast-decay synchronous rectification(2)
0	0	0	X	1	H	L	Fast-decay synchronous rectification(2)
X	X	X	X	0	Z	Z	Sleep mode

(1) X = Don't care, Z = high impedance
(2) To prevent reversal of current during fast-decay synchronous rectification, outputs go to the high-impedance state as the current approaches 0 A.

9.3.10 Overcurrent Protection

The current flowing through the high-side and low-side drivers is monitored to ensure that the motor lead is not shorted to supply or ground. If a short is detected, the full-bridge outputs are turned off, flag nFAULT is driven low, and a 1.2-ms fault timer is started. After this 1.2-ms period, t_{OCP} , the device is then allowed to follow the input commands and another turnon is attempted (nFAULT becomes high again during this attempt). If there is still a fault condition, the cycle repeats. If after t_{OCP} expires it is determined the short condition is not present, normal operation resumes and nFAULT is deasserted.

9.3.11 SENSE

A low-value resistor can be placed between the SENSE pin and ground for current-sensing purposes. To minimize ground-trace IR drops in sensing the output current level, the current-sensing resistor should have an independent ground return to the star ground point. This trace should be as short as possible. For low-value sense resistors, the IR drops in the PCB can be significant, and should be taken into account.

$$P_D = I^2(2 \bullet r_{DS(on)}Sink) \quad (1)$$

NOTE

When selecting a value for the sense resistor, SENSE does not exceed the maximum voltage of ±500 mV. The H-bridge is disabled and enters recirculation when any current in the motor windings generates a SENSE voltage greater than or equal to 500 mV.

9.4 Device Functional Modes

9.4.1 Device Operation

The DRV880x supports a low power sleep mode through the nSLEEP pin. In this mode the device shuts down a majority of the internal circuitry including the internal voltage rails and charge pump. Bringing the nSLEEP pin HIGH will put the device back into its active state.

During normal operation the DRV880x is designed to operate a single brushed DC motor. The outputs are connected to each side on the motor coil, allowing for full bidirectional control.

Device Functional Modes (continued)

9.4.1.1 Slow-Decay SR (Brake Mode)

In slow-decay mode, both low-side sinking drivers turn on, allowing the current to circulate through the H-bridge's low side (two sink drivers) and the load. Power dissipation I^2R loses in the two sink DMOS drivers:

9.4.1.2 Fast Decay With Synchronous Rectification

This decay mode is equivalent to a phase change where the opposite drivers are switched on. When in fast decay, the motor current is not allowed to go negative (direction change). Instead, as the current approaches zero, the drivers turn off. The power calculation is the same as the drive current calculation (see Equation 5).

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

DRV880x device is used in medium voltage brushed DC motor control applications.

10.2 Typical Application

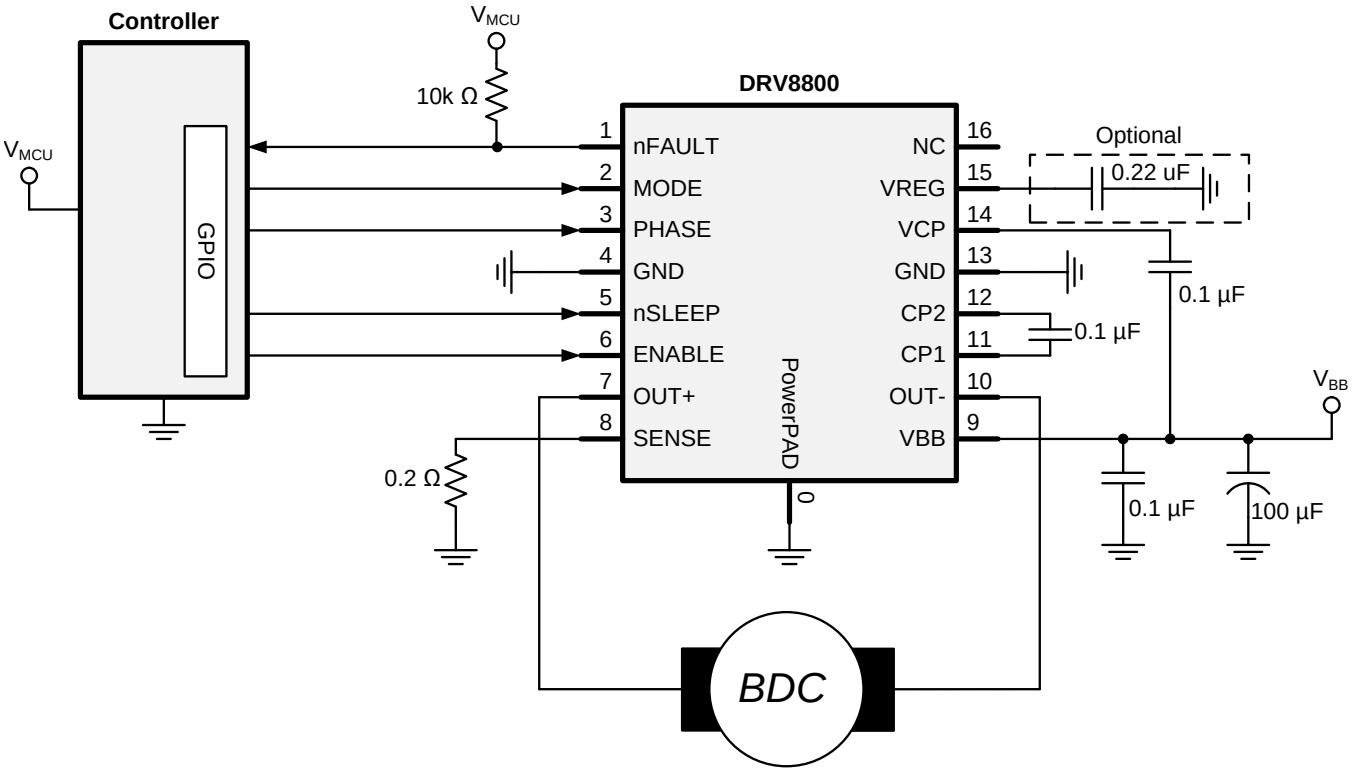

Figure 10. DRV8800 Typical Application Schematic

Typical Application (continued)

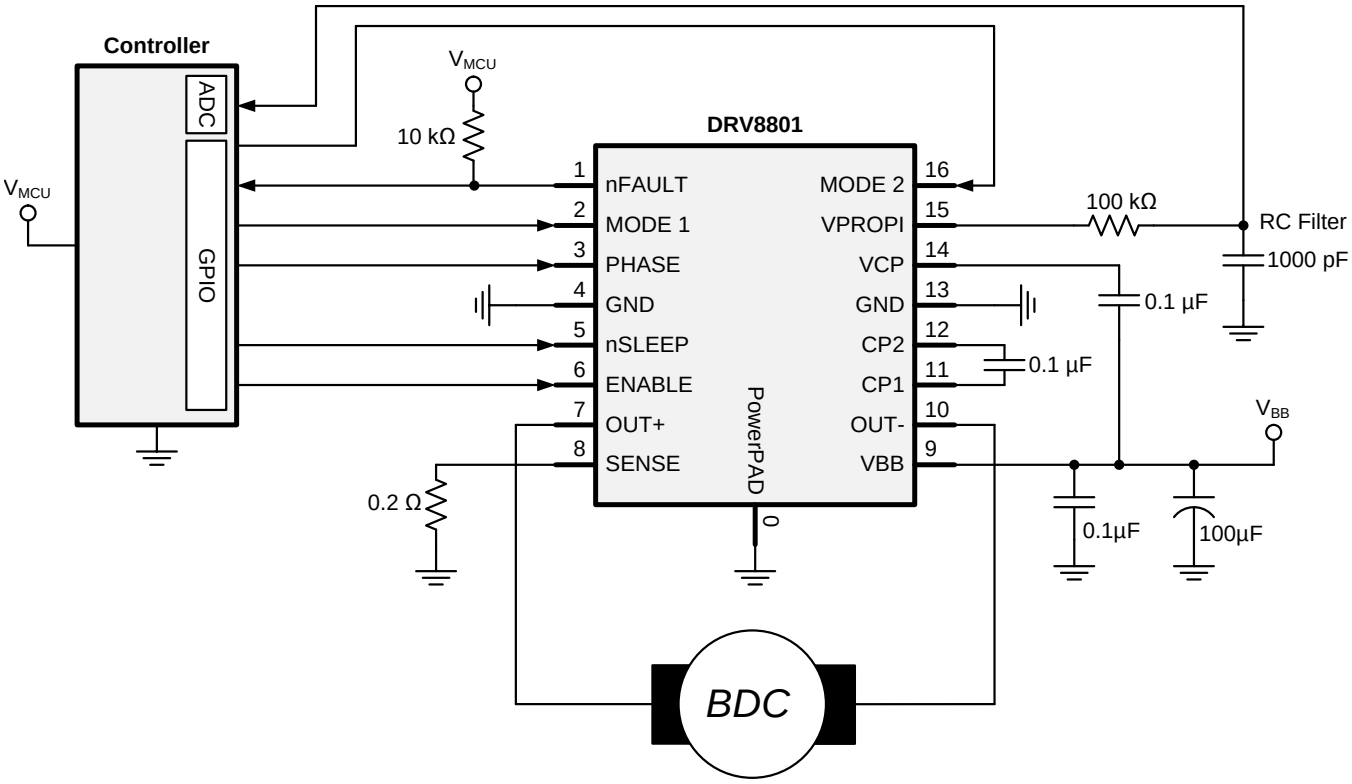

Figure 11. DRV8801 Typical Application Schematic

10.2.1 Design Requirements

For this design example, use the parameters listed in Table 2 as the input parameters.

Table 2. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor Voltage	VBB	24 V
Motor RMS Current	IRMS	0.8 A
Motor Startup Current	ISTART	2 A
Motor Current Trip Point	ITRIP	2.5 A

10.2.2 Detailed Design Procedure

10.2.2.1 Motor Voltage

The motor voltage to use will depend on the ratings of the motor selected and the desired RPM. A higher voltage spins a brushed DC motor faster with the same PWM duty cycle applied to the power FETs. A higher voltage also increases the rate of current change through the inductive motor windings.

10.2.2.2 Power Dissipation

The power dissipation of the DRV880x is a function of the RMS motor current and the each output's FET resistance ($R_{DS(ON)}$).

$$\text{Power} \approx I_{RMS}^2 \times (\text{High-Side } R_{DS(ON)} + \text{Low-Side } R_{DS(ON)}) \quad (2)$$

For this example, the ambient temperature is 35°C, and the junction temperature reaches 65°C. At 65°C, the sum of RDS(ON) is about 1Ω. With an example motor current of 0.8A, the dissipated power in the form of heat will be 0.8 A^2x 1 Ω = 0.64 W.

The temperature that the DRV880x reaches will depend on the thermal resistance to the air and PCB. It is important to solder the device PowerPAD to the PCB ground plane, with vias to the top and bottom board layers, to dissipate heat into the PCB and reduce the device temperature. In the example used here, the DRV880x had an effective thermal resistance $R_{\theta JA}$ of 47°C/W, and:

$$T_J = T_A + (P_D \times R_{\theta JA}) = 35°C + (0.64\ W \times 47°C/W) = 65°C \quad (3)$$

10.2.2.3 Motor Current Trip Point

When the voltage on pin SENSE exceeds V_{TRIP} (0.5 V), overcurrent is detected. The R_{SENSE} resistor should be sized to set the desired I_{TRIP} level.

$$R_{SENSE} = 0.5\ V / I_{TRIP} \quad (4)$$

To set I_{TRIP} to 2.5 A, R_{SENSE} = 0.5 V / 2.5 A = 0.2 Ω.

To prevent false trips, I_{TRIP} must be higher than regular operating current. Motor current during startup is typically much higher than steady-state spinning, because the initial load torque is higher, and the absence of back-EMF causes a higher voltage and extra current across the motor windings.

It can be beneficial to limit startup current by using series inductors on the DRV880x output, as that allows I_{TRIP} to be lower, and it may decrease the system's required bulk capacitance. Startup current can also be limited by ramping the forward drive duty cycle.

10.2.2.4 Sense Resistor Selection

For optimal performance, it is important for the sense resistor to be:

- Surface-mount
- Low inductance
- Rated for high enough power
- Placed closely to the motor driver

10.2.2.5 Drive Current

This current path is through the high-side sourcing DMOS driver, motor winding, and low-side sinking DMOS driver. Power dissipation I^2R loses in one source and one sink DMOS driver, as shown in Equation 5.

$$P_D = I^2(r_{DS(on)}Source + r_{DS(on)}Sink) \quad (5)$$

10.2.3 Application Curves

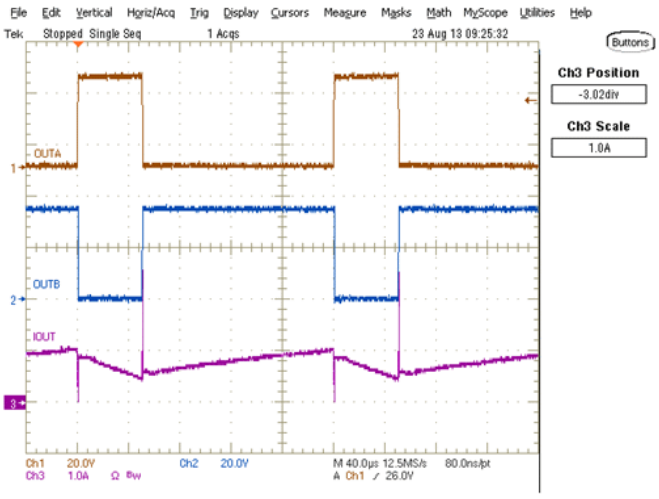

Figure 13. Reverse Drive, Fast Decay

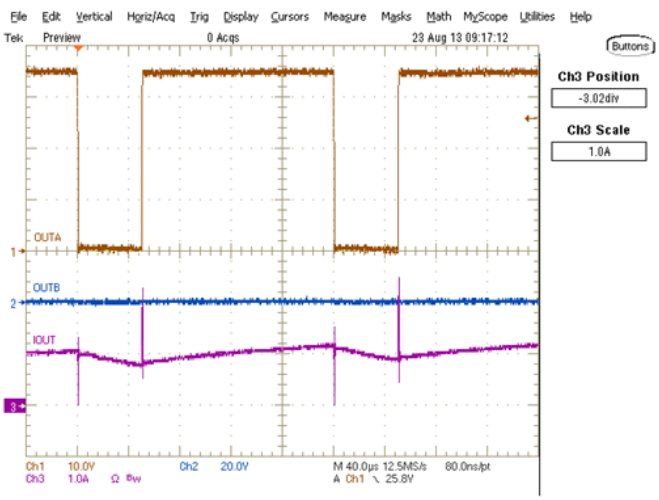

Figure 14. Forward Drive, Slow Decay

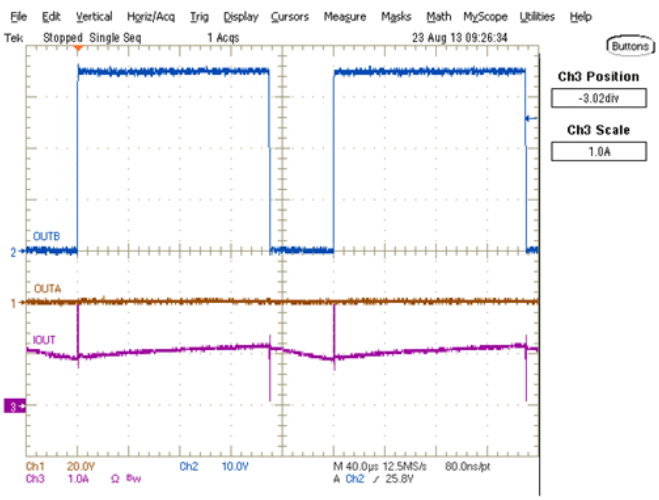

Figure 15. Reverse Drive, Slow Decay

11 Power Supply Recommendations

11.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system.
- The capacitance of the power supply and its ability to source current.
- The amount of parasitic inductance between the power supply and motor systems.
- The acceptable voltage ripple.
- The type of motor used (Brushed DC, Brushless DC, Stepper).
- The motor braking method.

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

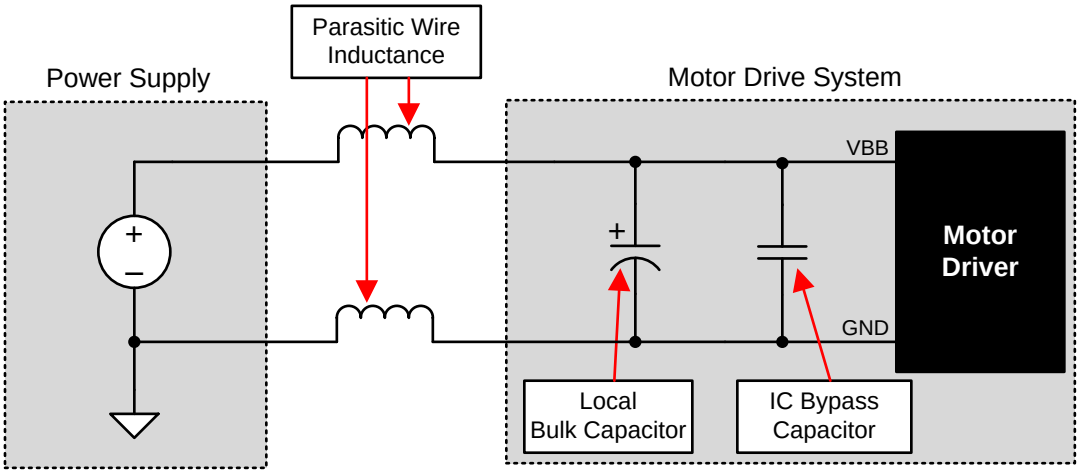

Figure 16. Example Setup of Motor Drive System With External Power Supply

12 Layout

12.1 Layout Guidelines

- The printed-circuit-board (PCB) should use a heavy ground plane. For optimal electrical and thermal performance, the DRV880x must be soldered directly onto the board. On the underside of the DRV880x is a thermal pad, which provides a path for enhanced thermal dissipation. The thermal pad should be soldered directly to an exposed surface on the PCB. Thermal vias are used to transfer heat to other layers of the PCB.
- The load supply pin VBB, should be decoupled with an electrolytic capacitor (typically 100 µF) in parallel with a ceramic capacitor (0.1 µF) placed as close as possible to the device.
- The ceramic capacitors (0.1 µF) between VCP and VBB and between CP1 and CP2 should be placed as close as possible to the device.
- The SENSE resistor should be close as possible to the SENSE pin and ground return to minimize parasitic inductance.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

OTHER QUALIFIED VERSIONS OF DRV8801 :

- Automotive: DRV8801-Q1

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

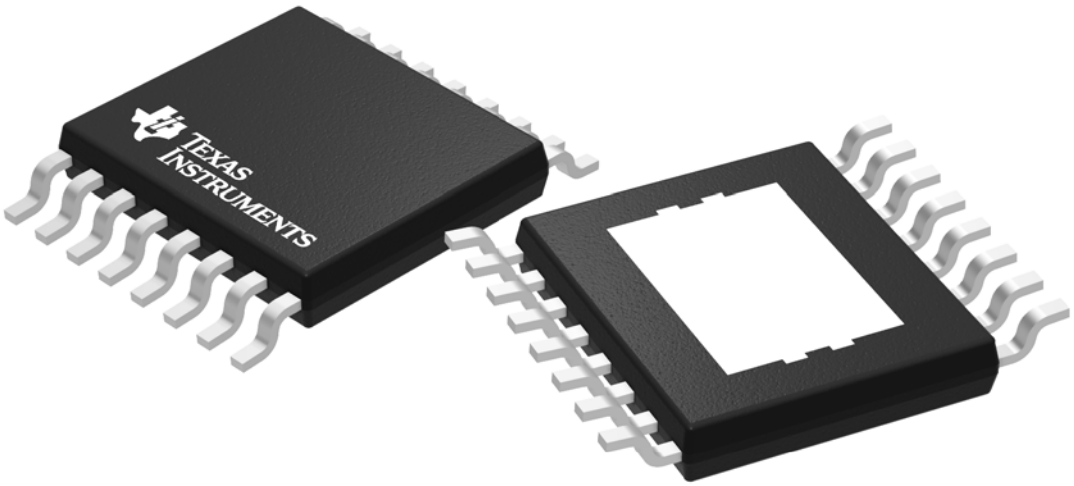
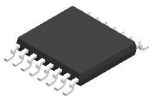
PWP 16 PowerPAD™ TSSOP - 1.2 mm max height

PLASTIC SMALL OUTLINE



Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

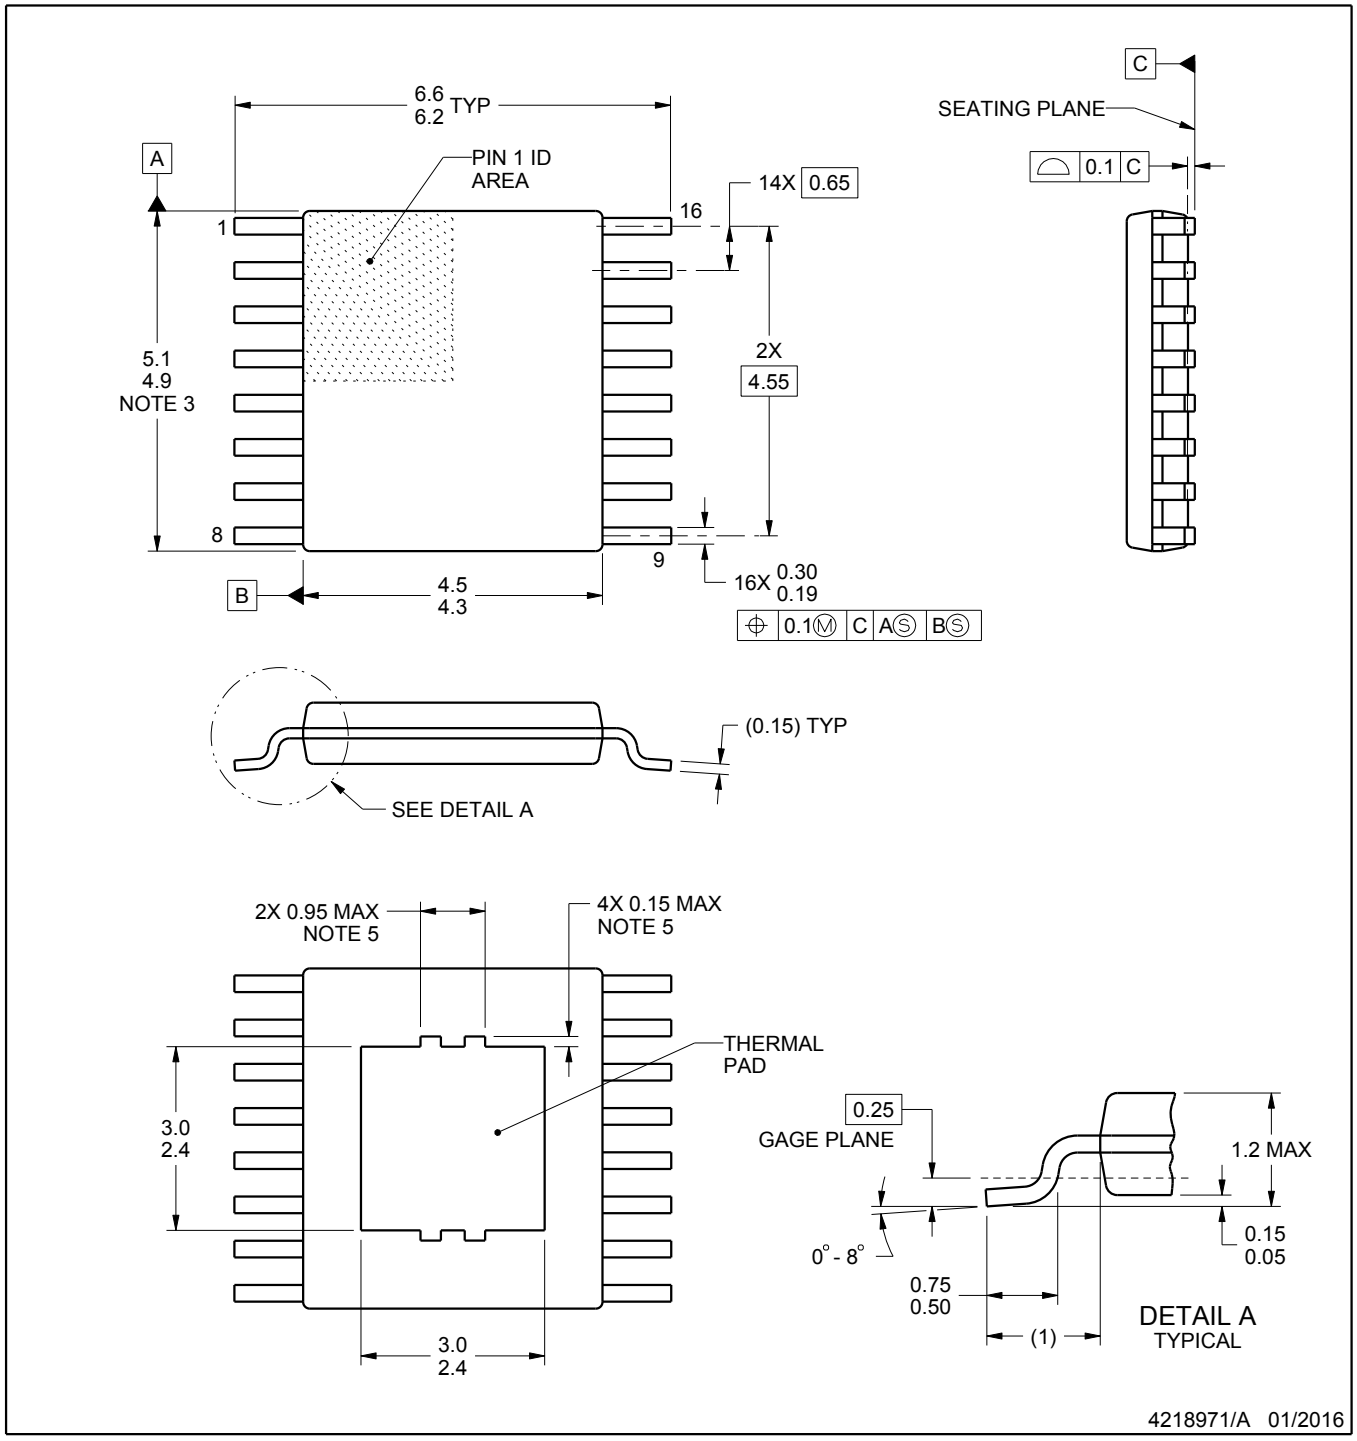


PACKAGE OUTLINE

PWP0016B

PowerPAD™ TSSOP - 1.2 mm max height

PLASTIC SMALL OUTLINE



PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may not be present.

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.

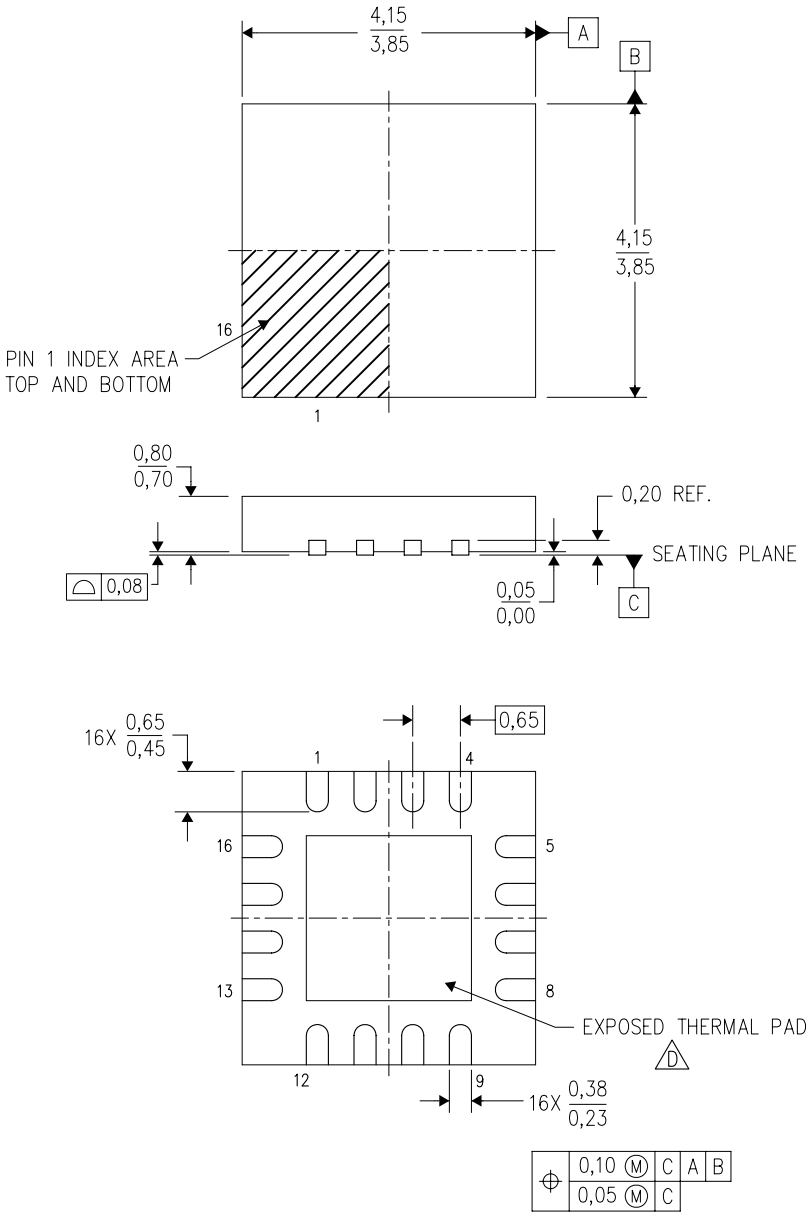
NOTES: (continued)

10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
11. Board assembly site may have different recommendations for stencil design.

RTY (S–PWQFN–N16) PLASTIC QUAD FLATPACK NO–LEAD



4206276/B 03/11

NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5–1994.
B. This drawing is subject to change without notice.
C. Quad Flatpack, No–leads (QFN) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MO–220.

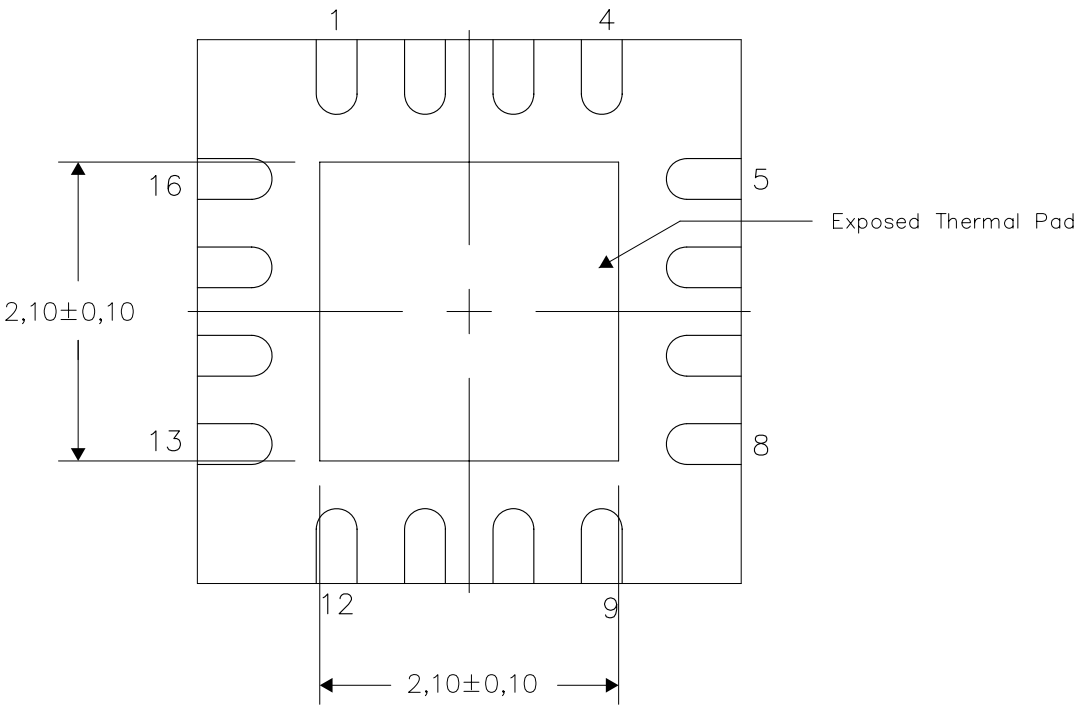
RTY (S–PWQFN–N16) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



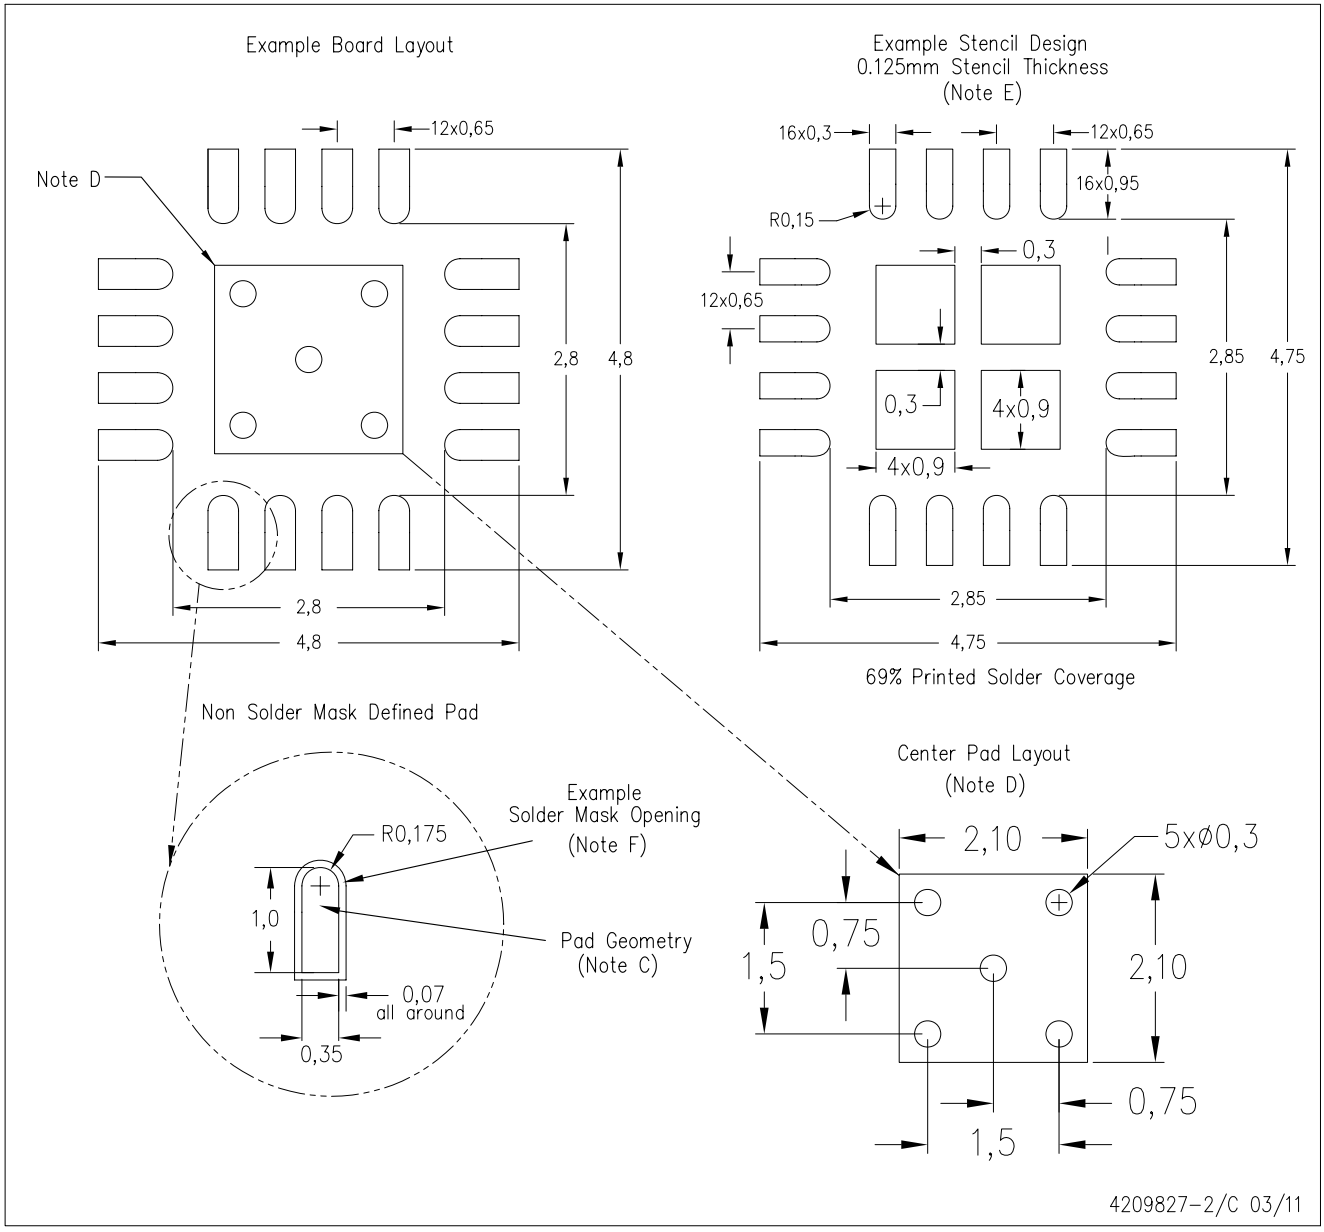
Bottom View

Exposed Thermal Pad Dimensions

4206277–2/E 03/11

NOTE: A. All linear dimensions are in millimeters

RTY (S–PWQFN–N16) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat–Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for solder mask tolerances.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
