

DS90LV028A 3-V LVDS Dual CMOS Differential Line Receiver

1 Features

- >400-Mbps (200 MHz) Switching Rates
- 50-ps Differential Skew (Typical)
- 0.1-ns Channel-to-Channel Skew (Typical)
- 2.5-ns Maximum Propagation Delay
- 3.3-V Power Supply Design
- Flow-Through Pinout
- Power Down High Impedance on LVDS Inputs
- Low Power Design (18 mW at 3.3-V static)
- Interoperable with Existing 5-V LVDS Networks
- Accepts Small Swing (350 mV Typical) Differential Signal Levels
- Supports Open, Short and Terminated Input Fail-Safe
- Conforms to ANSI/TIA/EIA-644 Standard
- Industrial Temperature Operating Range: -40°C to 85°C
- Available in SOIC and Space Saving WSON Package

2 Applications

- Multi-Function Printers
- LVDS-to-LVCMOS Translation
- Building and Factory Automation
- Grid Infrastructure

3 Description

The DS90LV028A is a dual CMOS differential line receiver designed for applications requiring ultra low power dissipation, low noise and high data rates. The device is designed to support data rates in excess of 400-Mbps (200 MHz) utilizing Low Voltage Differential Signaling (LVDS) technology.

The DS90LV028A accepts low voltage (350 mV typical) differential input signals and translates them to 3-V CMOS output levels. The receiver also supports open, shorted and terminated ($100\ \Omega$) input fail-safe. The receiver output is HIGH for all fail-safe conditions. The DS90LV028A has a flow-through design for easy PCB layout.

The DS90LV028A and companion LVDS line driver provide a new alternative to high power PECL/ECL devices for high speed point-to-point interface applications.

Device Information⁽¹⁾

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	5	—	Ground pin
R _{IN+}	2, 3	I	Noninverting receiver input pin
R _{IN-}	1, 4	I	Inverting receiver input pin
R _{OUT}	6, 7	O	Receiver output pin
V _{CC}	8	—	Power supply pin, 3.3 V ±0.3 V

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_{CC}		-0.3	4	V
Input voltage, R_{IN+} , R_{IN-}		-0.3	3.9	V
Output voltage, R_{OUT}		-0.3	$V_{CC} + 0.3$	V
Maximum package power dissipation at 25°C	D package	1025		mW
	Derate D package	8.2 mW/°C above 25°C		°C
	NGN package	3.3		W
	Derate NGN package	25.6 mW/°C above 25°C		°C
Lead temperature range, soldering (4 s)		260		°C
Junction temperature, T_J		150		°C
Storage temperature, T_{stg}		-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±7000	V
	Machine model (MM) ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) EIAJ, 0 Ω, 200 pF

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC} Supply voltage	Receiver input voltage	3	3.3	3.6	V
		GND		3	V
T_A Operating free-air temperature		-40	25	85	°C

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽²⁾	MAX	UNIT	
V _{TH}	Differential input high threshold	V _{CM} = 1.2 V, 0 V, 3 V, R _{IN+} , R _{IN-} pins ⁽³⁾			100	mV	
V _{TL}	Differential input low threshold	V _{CM} = 1.2 V, 0 V, 3 V, R _{IN+} , R _{IN-} pins ⁽³⁾	-100			mV	
I _{IN}	Input current	V _{CC} = 3.6 V or 0 V, R _{IN+} , R _{IN-} pins					
			V _{IN} = 2.8 V	-10	±1	10	μA
			V _{IN} = 0 V	-10	±1	10	
	V _{CC} = 0 V, V _{IN} = 3.6 V, R _{IN+} , R _{IN-} pins		-20		20		
V _{OH}	Output high voltage	I _{OH} = -0.4 mA, V _{ID} = 200 mV, R _{OUT} pin	2.7	3.1		V	
		I _{OH} = -0.4 mA, inputs terminated, R _{OUT} pin	2.7	3.1			
		I _{OH} = -0.4 mA, inputs shorted, R _{OUT} pin	2.7	3.1			
V _{OL}	Output low voltage	I _{OL} = 2 mA, V _{ID} = -200 mV, R _{OUT} pin		0.3	0.5	V	
I _{OS}	Output short-circuit current	V _{OUT} = 0 V, R _{OUT} pin ⁽⁴⁾	-15	-50	-100	mA	
V _{CL}	Input clamp voltage	I _{CL} = -18 mA, R _{OUT} pin	-1.5	-0.8		V	
I _{CC}	No load supply current	V _{CC} pin, inputs open		5.4	9	mA	

- (1) Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground unless otherwise specified (such as V_{ID}).
- (2) All typicals are given for: V_{CC} = 3.3 V and T_A = 25°C.
- (3) V_{CC} is always higher than R_{IN+} and R_{IN-} voltage. R_{IN+} and R_{IN-} are allowed to have voltage range -0.05 V to 3.05 V. V_{ID} is not allowed to be greater than 100 mV when V_{CM} = 0 V or 3 V.
- (4) Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only. Only one output must be shorted at a time, do not exceed maximum junction temperature specification.

6.6 Switching Characteristics

V_{CC} = 3.3 V ±10%, and T_A = -40°C to 85°C (unless otherwise noted)⁽¹⁾⁽²⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t _{PHLD}	Differential propagation delay high to low	C _L = 15 pF	1	1.6	2.5	ns
t _{PLHD}	Differential propagation delay low to high	V _{ID} = 200 mV	1	1.7	2.5	ns
t _{SKD1}	Differential pulse skew t _{PHLD} - t _{PLHD} ⁽³⁾	See Figure 18 and Figure 19	0	50	400	ps
t _{SKD2}	Differential channel-to-channel skew-same device ⁽⁴⁾		0	0.1	0.5	ns
t _{SKD3}	Differential part to part skew ⁽⁵⁾		0		1	ns
t _{SKD4}	Differential part to part skew ⁽⁶⁾		0		1.5	ns
t _{TLH}	Rise Time			325	800	ps
t _{THL}	Fall Time			225	800	ps
f _{MAX}	Maximum operating frequency ⁽⁷⁾		200	250		MHz

- (1) C_L includes probe and jig capacitance.
- (2) Generator waveform for all tests unless otherwise specified: f = 1 MHz, Z_O = 50 Ω, t_r and t_f (0% to 100%) ≤ 3 ns for R_{IN-}.
- (3) t_{SKD1} is the magnitude difference in differential propagation delay time between the positive-going-edge and the negative-going-edge of the same channel.
- (4) t_{SKD2} is the differential channel-to-channel skew of any event on the same device. This specification applies to devices having multiple receivers within the integrated circuit.
- (5) t_{SKD3}, part to part skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices at the same V_{CC} and within 5°C of each other within the operating temperature range.
- (6) t_{SKD4}, part to part skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices over the recommended operating temperature and voltage ranges, and across process distribution. t_{SKD4} is defined as |Maximum - Minimum| differential propagation delay.
- (7) f_{MAX} generator input conditions: t_r = t_f < 1 ns (0% to 100%), 50% duty cycle, differential (1.05V to 1.35 peak to peak). Output criteria: 60%/40% duty cycle, V_{OL} (max 0.4V), V_{OH} (min 2.7V), load = 15 pF (stray plus probes).

8 Detailed Description

8.1 Overview

LVDS drivers and receivers are intended to be primarily used in an uncomplicated point-to-point configuration as is shown in [Figure 20](#). This configuration provides a clean signaling environment for the fast edge rates of the drivers. The receiver is connected to the driver through a balanced media which may be a standard twisted pair cable, a parallel pair cable, or simply PCB traces. Typically, the characteristic impedance of the media is in the range of 100 Ω . A termination resistor of 100 Ω (selected to match the media), and is placed as close to the receiver input pins as possible. The termination resistor converts the driver output (current mode) into a voltage that is detected by the receiver. Other configurations are possible such as a multi-receiver configuration, but the effects of a mid-stream connector(s), cable stub(s), and other impedance discontinuities as well as ground shifting, noise margin limits, and total termination loading must be considered.

8.2 Functional Block Diagram

8.3 Feature Description

The DS90LV028A differential line receiver is capable of detecting signals as low as 100 mV, over a ± 1 -V common mode range centered around 1.2 V. This is related to the driver offset voltage which is typically 1.2 V. The driven signal is centered around this voltage and may shift ± 1 V around this center point. The ± 1 -V shifting may be the result of a ground potential difference between the driver's ground reference and the receiver's ground reference, the common mode effects of coupled noise, or a combination of the two. The AC parameters of both receiver input pins are optimized for a recommended operating input voltage range of 0 V to 2.4 V (measured from each pin to ground). The device operates for receiver input voltages up to V_{CC} , but exceeding V_{CC} turns on the ESD protection circuitry which clamps the bus voltages.

Feature Description (continued)

8.3.1 Fail-Safe Feature

The LVDS receiver is a high gain, high speed device that amplifies a small differential signal (20 mV) to CMOS logic levels. Due to the high gain and tight threshold of the receiver, take care to prevent noise from appearing as a valid signal.

The internal fail-safe circuitry of the receiver is designed to source or sink a small amount of current, providing fail-safe protection (a stable known state of HIGH output voltage) for floating, terminated or shorted receiver inputs.

1. **Open Input Pins:** The DS90LV028A is a dual receiver device, and if an application requires only 1 receiver, the unused channel inputs must be left OPEN. Do not tie unused receiver inputs to ground or any other voltages. The input is biased by internal high value pull up and pull down resistors to set the output to a HIGH state. This internal circuitry ensures a HIGH, stable output state for open inputs.
2. **Terminated Input:** If the driver is disconnected (cable unplugged), or if the driver is in a power-off condition, the receiver output is again in a HIGH state, even with the end of cable 100Ω termination resistor across the input pins. The unplugged cable can become a floating antenna which can pick up noise. If the cable picks up more than 10 mV of differential noise, the receiver may see the noise as a valid signal and switch. To insure that any noise is seen as common mode and not differential, a balanced interconnect must be used. Twisted pair cable offers better balance than flat ribbon cable.
3. **Shorted Inputs:** If a fault condition occurs that shorts the receiver inputs together, thus resulting in a 0 V differential input voltage, the receiver output remains in a HIGH state. Shorted input fail-safe is not supported across the common mode range of the device (GND to 2.4 V). It is only supported with inputs shorted and no external common mode voltage applied.

External lower value pull up and pull down resistors (for a stronger bias) may be used to boost fail-safe in the presence of higher noise levels. The pull up and pull down resistors must be in the 5-kΩ to 15-kΩ range to minimize loading and waveform distortion to the driver. The common mode bias point must be set to approximately 1.2 V (less than 1.75 V) to be compatible with the internal circuitry. Refer to [AN-1194 Failsafe Biasing of LVDS Interfaces](#) (SNLA051) for more information.

8.3.2 Cables and Connectors

When choosing cable and connectors for LVDS it is important to remember:

Use controlled impedance media. The cables and connectors you use must have a matched differential impedance of about 100 Ω. They must not introduce major impedance discontinuities.

Balanced cables (for example, twisted pair) are usually better than unbalanced cables (ribbon cable, simple coax) for noise reduction and signal quality. Balanced cables tend to generate less EMI due to field canceling effects and also tend to pick up electromagnetic radiation a common mode (not differential mode) noise which is rejected by the receiver.

For cable distances < 0.5 M, most cables can be made to work effectively. For distances 0.5 M ≤ d ≤ 10 M, CAT 3 (category 3) twisted pair cable works well, is readily available, and relatively inexpensive.

8.4 Device Functional Modes

[Table 1](#) lists the functional modes of the DS90LV028A.

Table 1. Truth Table

INPUTS	OUTPUT
$[R_{IN+}] - [R_{IN-}]$	R_{OUT}
$V_{ID} \geq 0.1 \text{ V}$	H
$V_{ID} \leq -0.1 \text{ V}$	L
Full fail-safe OPEN/SHORT or Terminated	H

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DS90LV028A has a flow-through pinout that allows for easy PCB layout. The LVDS signals on one side of the device easily allows for matching electrical lengths of the differential pair trace lines between the driver and the receiver as well as allowing the trace lines to be close together to couple noise as common mode. Noise isolation is achieved with the LVDS signals on one side of the device and the TTL signals on the other side.

9.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

Figure 20. Point-to-Point Application

9.2.1 Design Requirements

When using LVDS devices, it is important to remember to specify controlled impedance PCB traces, cable assemblies, and connectors. All components of the transmission media must have a matched differential impedance of about 100 Ω. They must not introduce major impedance discontinuities.

Balanced cables (for example, twisted pair) are usually better than unbalanced cables (ribbon cable) for noise reduction and signal quality. Balanced cables tend to generate less EMI due to field canceling effects and also tend to pick up electromagnetic radiation as common mode (not differential mode) noise which is rejected by the LVDS receiver.

For cable distances < 0.5 M, most cables can be made to work effectively. For distances $0.5 \text{ M} \leq d \leq 10 \text{ M}$, CAT5 (Category 5) twisted pair cable works well, is readily available, and relatively inexpensive.

9.2.2 Detailed Design Procedure

9.2.2.1 Probing LVDS Transmission Lines

Always use high impedance ($>100 \text{ k}\Omega$), low capacitance ($<2 \text{ pF}$) scope probes with a wide bandwidth (1 GHz) scope. Improper probing gives deceiving results.

9.2.2.2 Threshold

The LVDS Standard (ANSI/TIA/EIA-644) specifies a maximum threshold of $\pm 100 \text{ mV}$ for the LVDS receiver. The DS90LV028A supports an enhanced threshold region of -100 mV to 0 V . This is useful for fail-safe biasing. The threshold region is shown in the Voltage Transfer Curve (VTC) in [Figure 21](#). The typical DS90LV028A LVDS receiver switches at about -35 mV .

NOTE

With $V_{ID} = 0 \text{ V}$, the output is in a HIGH state. With an external fail-safe bias of 25 mV applied, the typical differential noise margin is now the difference from the switch point to the bias point.

Typical Application (continued)

In the following example, this would be 60 mV of Differential Noise Margin (25 mV – (-35 mV)). With the enhanced threshold region of -100 mV to 0 V, this small external fail-safe biasing of 25 mV (with respect to 0 V) gives a DNM of a comfortable 60 mV. With the standard threshold region of ±100 mV, the external fail-safe biasing would require 25 mV with respect to 100 mV or 125 mV, giving a DNM of 160 mV which is stronger fail-safe biasing than is necessary for the DS90LV028A. If more differential noise margin (DNM) is required, then a stronger fail-safe bias point can be set by changing resistor values.

Figure 21. VTC of the DS90LV028A

9.2.3 Application Curve

Figure 22. Power Supply Current vs Frequency

10 Power Supply Recommendations

Bypass capacitors must be used on power pins. TI recommends using high-frequency, ceramic, 0.1- μ F and 0.01- μ F capacitors in parallel at the power supply pin with the smallest value capacitor closest to the device supply pin. Additional scattered capacitors over the printed-circuit board improves decoupling. Multiple vias must be used to connect the decoupling capacitors to the power planes. A 10- μ F, 35-V (or greater) solid tantalum capacitor must be connected at the power entry point on the printed-circuit board between the supply and ground.

11 Layout

11.1 Layout Guidelines

Use at least 4 PCB board layers (top to bottom): LVDS signals, ground, power, and TTL signals.

Isolate TTL signals from LVDS signals, otherwise the TTL signals may couple onto the LVDS lines. Best practice places TTL and LVDS on different layers which are isolated by a power or ground plane(s).

Keep drivers and receivers as close to the (LVDS port side) connectors as possible.

For PC board considerations for the WSON package, please refer to [AN-1187, Leadless Leadframe Package \(SNOA401\)](#). It is important to note that to optimize signal integrity (minimize jitter and noise coupling), the WSON thermal land pad, which is a metal (normally copper) rectangular region placed under the package as seen in [Figure 23](#), must be attached to ground and match the dimensions of the exposed pad on the PCB (1:1 ratio).

11.1.1 Differential Traces

Use controlled impedance traces which match the differential impedance of your transmission medium (that is, cable) and termination resistor. Run the differential pair trace lines as close together as possible as soon as they leave the IC (stubs must be <10 mm long). This helps eliminate reflections and ensure noise is coupled as common mode. In fact, we have seen that differential signals which are 1mm apart radiate far less noise than traces 3 mm apart because magnetic field cancellation is much better with the closer traces. In addition, noise induced on the differential lines is much more likely to appear as common mode which is rejected by the receiver.

Match electrical lengths between traces to reduce skew. Skew between the signals of a pair means a phase difference between signals which destroys the magnetic field cancellation benefits of differential signals and the EMI result. The velocity of propagation, $v = c/E$, where c (the speed of light) = 0.2997 mm/ps or 0.0118 in/ps. Do not rely solely on the autoroute function for differential traces. Carefully review dimensions to match differential impedance and provide isolation for the differential lines. Minimize the number of vias and other discontinuities on the line.

Avoid 90° turns (these cause impedance discontinuities). Use arcs or 45° bevels.

Within a pair of traces, the distance between the two traces must be minimized to maintain common mode rejection of the receivers. On the printed-circuit board, this distance must remain constant to avoid discontinuities in differential impedance. Minor violations at connection points are allowable.

11.1.2 Termination

Use a termination resistor which best matches the differential impedance or your transmission line. The resistor must be between 90 Ω and 130 Ω . Remember that the current mode outputs require the termination resistor to generate the differential voltage. LVDS does not work correctly without resistor termination. Typically, connecting a single resistor across the pair at the receiver end will suffice.

Surface mount 1% to 2% resistors are the best. PCB stubs, component lead, and the distance from the termination to the receiver inputs must be minimized. The distance between the termination resistor and the receiver must be <10 mm (12 mm maximum).

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

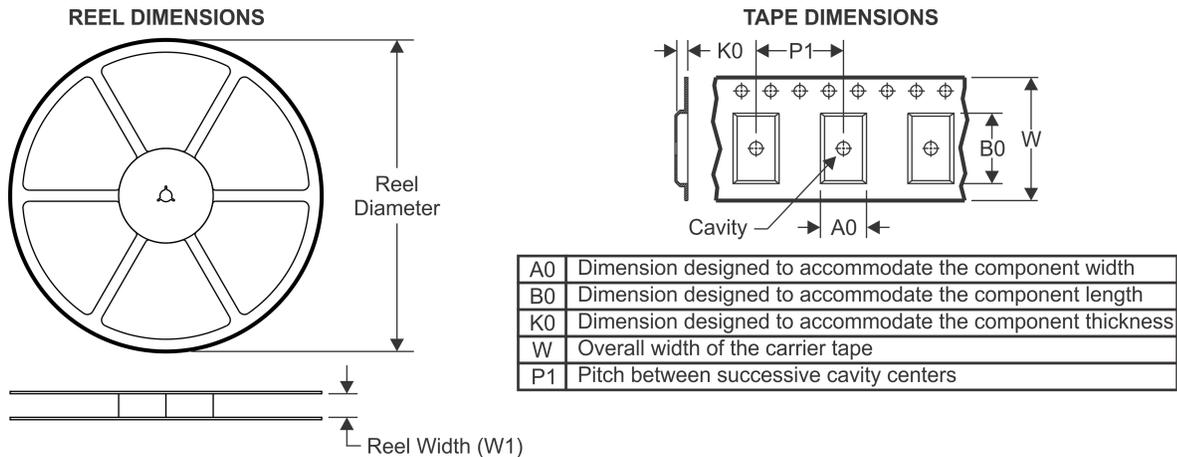

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 E. Reference JEDEC MS-012 variation AA.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
