

INA20x High-Side Measurement Current-Shunt Monitor With Open-Drain Comparator and Reference

1 Features

- Complete Current Sense Solution
- Three Gain Options Available:
 - INA200 = 20 V/V
 - INA201 = 50 V/V
 - INA202 = 100 V/V
- 0.6-V Internal Voltage Reference
- Internal Open-Drain Comparator
- Latching Capability on Comparator
- Common-Mode Range: –16 V to 80 V
- High Accuracy: 3.5% Maximum Error Over Temperature
- Bandwidth: 500 kHz (INA200)
- Quiescent Current: 1800 μ A (Maximum)
- Packages: SOIC-8, VSSOP-8

2 Applications

- Notebook Computers
- Cell Phones
- Telecom Equipment
- Automotive
- Power Management
- Battery Chargers
- Welding Equipment

3 Description

The INA200, INA201, and INA202 devices are high-side current-shunt monitors with voltage output and integrated comparator. The INA20x devices can sense drops across shunts at common-mode voltages from –16 V to 80 V. The INA20x series is available with three output voltage scales: 20 V/V, 50 V/V, and 100 V/V, with a bandwidth up to 500-kHz.

The INA200, INA201, and INA202 devices incorporate an open-drain comparator and internal reference providing a 0.6-V threshold. External dividers set the current trip point. The comparator includes a latching capability, that can be made transparent by grounding (or leaving open) the RESET pin.

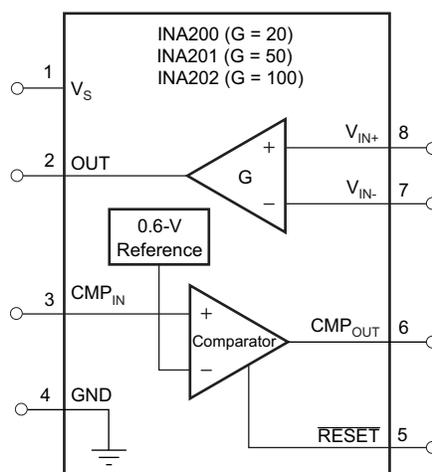

The INA200, INA201, and INA202 devices operate from a single 2.7-V to 18-V supply, drawing a maximum of 1800 μ A of supply current. Package options include the very small VSSOP-8 and the SOIC-8. All versions are specified over the extended operating temperature range of –40°C to +125°C.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA200	SOIC (8)	4.90 mm x 3.91 mm
INA201	VSSOP (8)	3.00 mm x 3.00 mm
INA202		

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CMP _{IN}	3	Analog input	Comparator input
CMP _{OUT}	6	Analog output	Comparator output
GND	4	Analog	Ground
OUT	2	Analog output	Output voltage
$\overline{\text{RESET}}$	5	Analog input	Comparator reset pin, active low
V _{IN-}	7	Analog input	Connect to shunt low side
V _{IN+}	8	Analog input	Connect to shunt high side
V _S	1	Analog	Power supply

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_s		2.7	18	V
Current-shunt monitor analog inputs, V_{IN+} , V_{IN-}	Differential (V_{IN+}) – (V_{IN-})	–18	18	V
	Common-mode ⁽²⁾	–16	80	V
Comparator analog input and reset pins ⁽²⁾		GND – 0.3	(V_s) + 0.3	V
Analog output, OUT ⁽²⁾		GND – 0.3	(V_s) + 0.3	V
Comparator output, OUT ⁽²⁾		GND – 0.3	18	V
Input current into any pin ⁽²⁾			5	mA
Operating temperature		–55	150	°C
Junction temperature		–65	150	°C
Storage temperature, T_{stg}		–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) This voltage may exceed the ratings shown if the current at that pin is limited to 5 mA.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±4000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CM}	Common-mode input voltage	–16	12	80	V
V_s	Operating supply voltage	2.7	12	18	V
T_A	Operating free-air temperature	–40	25	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	INA20x		UNIT	
	D (SOIC)	DGK (SOIC)		
	8 PINS	8 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	110.5	162.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	50.4	37.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	52.7	82.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	7.8	1.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	51.9	81.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics: Current-Shunt Monitor

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{\text{CM}} = 12\text{ V}$, $V_{\text{SENSE}} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{\text{PULL-UP}} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $\text{CMP}_{\text{IN}} = \text{GND}$, (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT						
V_{SENSE}	Full-scale sense input voltage	$V_{\text{SENSE}} = V_{\text{IN+}} - V_{\text{IN-}}$		0.15	$(V_S - 0.25) / \text{Gain}$	V
V_{CM}	Common-mode input range	$T_A = -40^\circ\text{C}$ to 125°C	-16		80	V
CMR	Common-mode rejection	$V_{\text{IN+}} = -16\text{ V}$ to 80 V	80	100		dB
		$V_{\text{IN+}} = 12\text{ V}$ to 80 V , $T_A = -40^\circ\text{C}$ to 125°C	100	123		dB
V_{OS}	Offset voltage, RTI ⁽¹⁾	$T_A = 25^\circ\text{C}$		± 0.5	± 2.5	mV
		$T_A = 25^\circ\text{C}$ to 125°C			± 3	mV
		$T_A = -40^\circ\text{C}$ to 25°C			± 3.5	mV
dV_{OS}/dT	Offset voltage, RTI, vs temperature	T_{MIN} to T_{MAX} , $T_A = -40^\circ\text{C}$ to 125°C		5		$\mu\text{V}/^\circ\text{C}$
PSR	Offset voltage, RTI, vs power supply	$V_{\text{OUT}} = 2\text{ V}$, $V_{\text{IN+}} = 18\text{ V}$, 2.7 V , $T_A = -40^\circ\text{C}$ to 125°C		2.5	100	$\mu\text{V}/\text{V}$
I_B	Input bias current, $V_{\text{IN-}}$ pin	$T_A = -40^\circ\text{C}$ to 125°C		± 9	± 16	μA

(1) Offset is extrapolated from measurements of the output at 20-mV and 100-mV V_{SENSE} .

Electrical Characteristics: Current-Shunt Monitor (continued)

 at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = \text{GND}$, (unless otherwise noted)

 (2) Total output error includes effects of gain error and V_{OS} .

(3) Linearity is best fit to a straight line.

 (4) For details on this region of operation, see [Accuracy Variations](#) section in [Device Functional Modes](#).

 (5) See [Figure 8](#).

(6) Specified by design.

6.6 Electrical Characteristics: Comparator

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, and $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE					
Threshold	$T_A = 25^\circ\text{C}$	590	608	620	mV
	$T_A = -40^\circ\text{C}$ to 125°C	586		625	mV
Hysteresis ⁽¹⁾	$T_A = -40^\circ\text{C}$ to 85°C		-8		mV
INPUT BIAS CURRENT⁽²⁾					
Input bias current, CMP_{in} PIN			0.005	10	nA
Input bias current, CMP_{in} PIN, vs temperature	$T_A = -40^\circ\text{C}$ to 125°C			15	nA
INPUT VOLTAGE RANGE					
Input voltage range, CMP_{in} PIN		0 V to $V_S - 1.5\text{ V}$			V
OUTPUT (OPEN-DRAIN)					
Large-signal differential voltage gain	$CMP\ V_{OUT} 1\text{ V}$ to 4 V , $R_L \geq 15\text{ k}\Omega$ connected to 5 V		200		V/mV
I_{LKG} High-level leakage current ⁽³⁾⁽⁴⁾	$V_{ID} = 0.4\text{ V}$, $V_{OH} = V_S$		0.0001	1	μA
V_{OL} Low-level output voltage ⁽³⁾	$V_{ID} = -0.6\text{ V}$, $I_{OL} = 2.35\text{ mA}$		220	300	mV
RESPONSE TIME					
Response time ⁽⁵⁾	R_L to 5 V , $C_L = 15\text{ pF}$, 100-mV Input Step with 5-mV overdrive		1.3		μs
RESET					
$\overline{\text{RESET}}$ threshold ⁽⁶⁾			1.1		V
Logic input impedance			2		$\text{M}\Omega$
Minimum $\overline{\text{RESET}}$ pulse width			1.5		μs
$\overline{\text{RESET}}$ propagation delay			3		μs

- (1) Hysteresis refers to the threshold (the threshold specification applies to a rising edge of a noninverting input) of a falling edge on the noninverting input of the comparator; refer to [Figure 1](#).
- (2) Specified by design.
- (3) V_{ID} refers to the differential voltage at the comparator inputs.
- (4) Open-drain output can be pulled to the range of 2.7 to 18 V, regardless of V_S .
- (5) The comparator response time specified is the interval between the input step function and the instant when the output crosses 1.4 V.
- (6) The $\overline{\text{RESET}}$ input has an internal $2\text{ M}\Omega$ (typical) pull-down. Leaving $\overline{\text{RESET}}$ open results in a LOW state, with transparent comparator operation.

6.7 Electrical Characteristics: General

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = 1\text{ V}$, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY					
V_S Operating power supply	$T_A = -40^\circ\text{C}$ to 125°C	2.7		18	V
I_Q Quiescent current	$V_{OUT} = 2\text{ V}$		1350	1800	μA
	$V_{SENSE} = 0\text{ mV}$, $T_A = -40^\circ\text{C}$ to 125°C			1850	μA
Comparator power-on reset threshold ⁽¹⁾			1.5		V
TEMPERATURE					
Specified temperature		-40		125	$^\circ\text{C}$
Operating temperature		-55		150	$^\circ\text{C}$
Storage temperature		-65		150	$^\circ\text{C}$
θ_{JA} Thermal resistance	VSSOP-8 Surface-Mount		200		$^\circ\text{C}/\text{W}$
	SOIC-8		150		$^\circ\text{C}/\text{W}$

- (1) The INA200, INA201, and INA202 are designed to power-up with the comparator in a defined reset state as long as $\overline{\text{RESET}}$ is open or grounded. The comparator is in reset as long as the power supply is below the voltage shown here. The comparator assumes a state based on the comparator input above this supply voltage. If $\overline{\text{RESET}}$ is high at power-up, the comparator output comes up high and requires a reset to assume a low state, if appropriate.

7 Detailed Description

7.1 Overview

The INA200, INA201, and INA202 devices are high-side current-shunt monitors with voltage output. The INA20x devices can sense drops across shunts at common-mode voltages from -16 V to 80 V . The INA200–INA202 devices are available with three output voltage scales: 20 V/V , 50 V/V , and 100 V/V , with up to 500-kHz bandwidth. The INA200, INA201, and INA202 devices incorporate an open-drain comparator and internal reference providing a 0.6-V threshold. External dividers set the current trip point. The comparator includes a latching capability, that can be made transparent by grounding (or leaving open) the RESET pin. The INA200, INA201, and INA202 devices operate from a single 2.7 to 18-V supply, drawing a maximum of $1800\text{ }\mu\text{A}$ of supply current. Package options include the very small MSOP-8 and the SO-8. All versions are specified over the extended operating temperature range of -40°C to $+125^\circ\text{C}$.

7.2 Functional Block Diagram

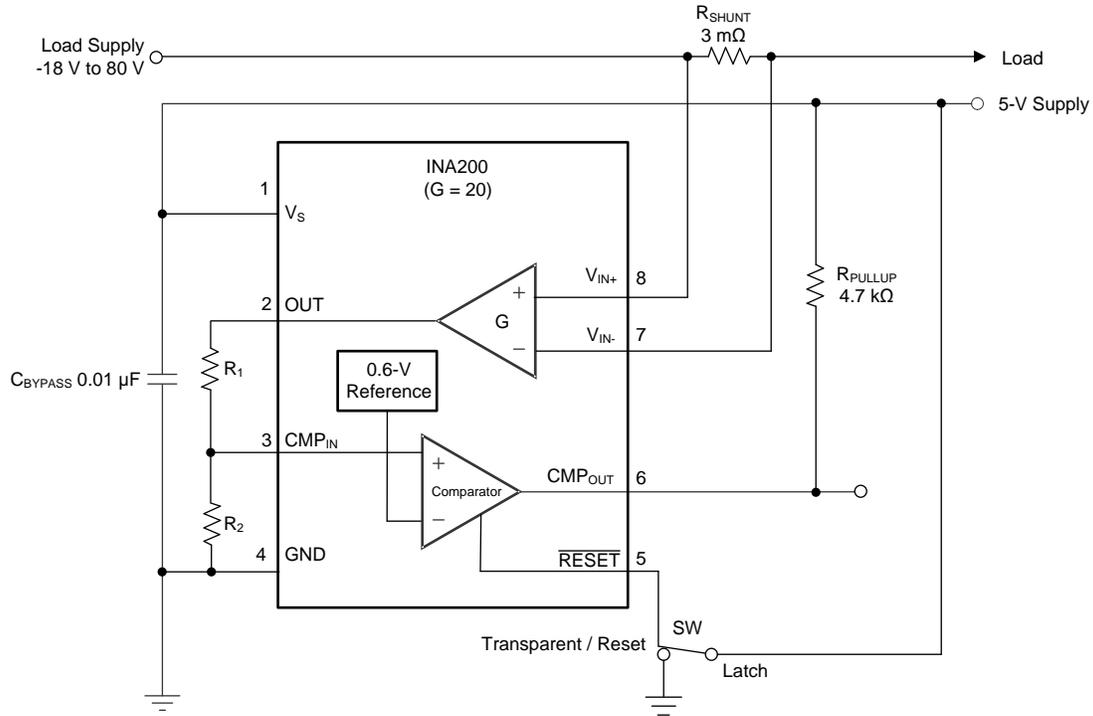

7.3 Feature Description

7.3.1 Basic Connections

Figure 26 shows the basic connections of the INA20x devices. The input pins (V_{IN+} and V_{IN-}) must be connected as closely as possible with Kelvin connections to the shunt resistor to minimize any resistance in series with the shunt resistance.

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

Copyright © 2017, Texas Instruments Incorporated

Figure 26. INA200 Basic Connections

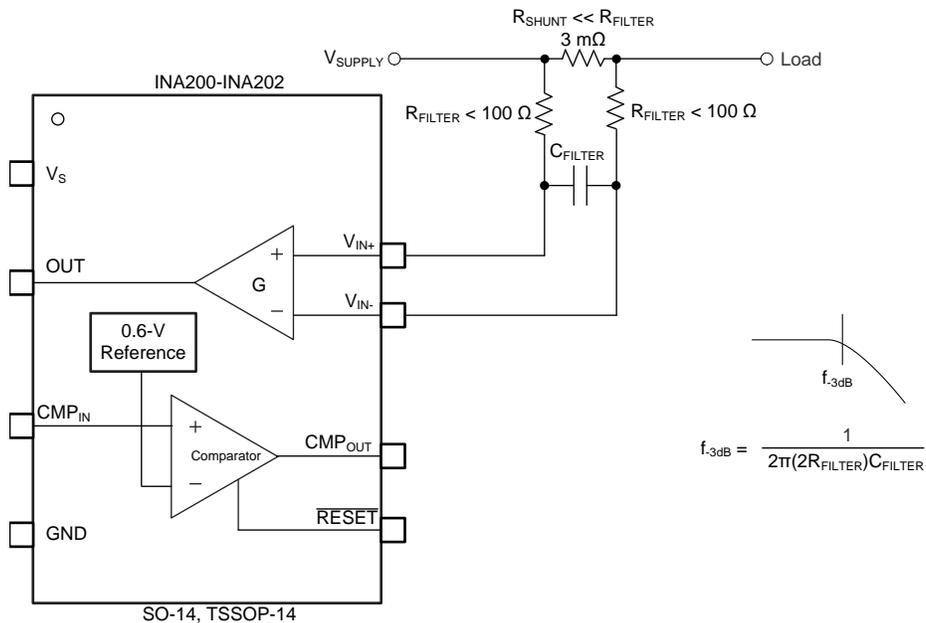

7.3.2 Selecting R_S

The selected value for the shunt resistor, R_S , depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply line. For most applications, using an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV results in the best performance. Maximum input voltage for accurate measurements is 500 mV, but output voltage is limited by supply.

7.3.3 Comparator

The INA200, INA201, and INA202 devices incorporate an open-drain comparator. This comparator typically has 2 mV of offset and a 1.3- μ s (typical) response time. The output of the comparator latches and is reset through the $\overline{\text{RESET}}$ pin; see [Figure 28](#).

When V_S and $\overline{\text{RESET}}$ are different, TI recommends adding a low-pass filter (LPF) on the $\overline{\text{RESET}}$ pin to avoid comparator behavior inconsistent with the data sheet. For instance, with a 12-V supply and a 3.3-V $\overline{\text{RESET}}$, a rise time of 400 ns is appropriate. Similarly, with an 18-V supply and a 2.7-V $\overline{\text{RESET}}$, a 1- μ s rise time is appropriate; see [Figure 31](#).

$$f_{-3dB} = \frac{1}{2\pi(2R_{FILTER})C_{FILTER}}$$

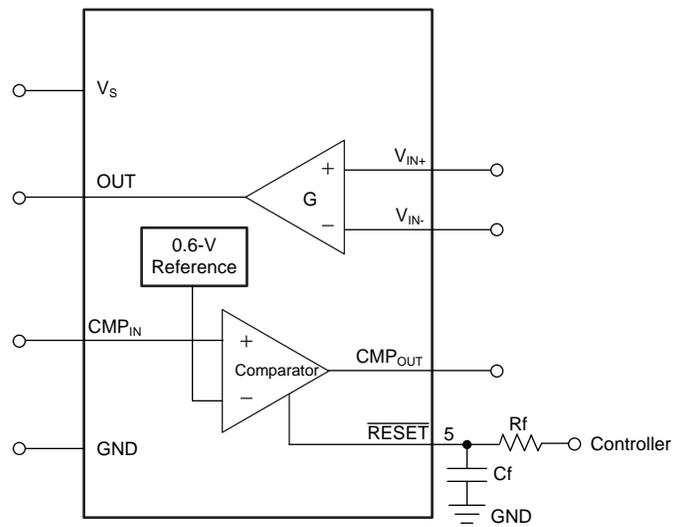

Figure 31. Filter on \overline{RESET} Pin

7.4 Device Functional Modes

7.4.1 Input Filtering

An obvious and straightforward location for filtering is at the output of the INA20x series; however, this location negates the advantage of the low output impedance of the internal buffer. The only other option for filtering is at the input pins of the INA20x devices, which is complicated by the internal 5 kΩ + 30% input impedance. This is shown in [Figure 27](#). Using the lowest possible resistor values minimizes the initial shift in gain and effects of tolerance. The effect on initial gain is shown in [Equation 1](#):

$$\text{Gain Error \%} = 100 - \left(100 \times \frac{5\text{k}\Omega}{5\text{k}\Omega + R_{\text{FILT}}} \right) \quad (1)$$

Total effect on gain error can be calculated by replacing the 5-kΩ term with 5 kΩ – 30%, (or 3.5 kΩ) or 5 kΩ + 30% (or 6.5 kΩ). The tolerance extremes of R_{FILT} can be inserted into the equation. If a pair of 100-Ω 1% resistors are used on the inputs, the initial gain error equals 1.96%. Worst-case tolerance conditions always occur at the lower excursion of the internal 5-kΩ resistor (3.5 kΩ), and the higher excursion of R_{FILT} – 3% in this case.

The specified accuracy of the INA20x devices must then be combined in addition to these tolerances. While this discussion treated accuracy worst-case conditions by combining the extremes of the resistor values, it is appropriate to use geometric mean or root sum square calculations to total the effects of accuracy variations.

7.4.2 Accuracy Variations as a Result of V_{SENSE} and Common-Mode Voltage

The accuracy of the INA200, INA201, and INA202 current shunt monitors is a function of two main variables: V_{SENSE} (V_{IN+} – V_{IN-}), common-mode voltage, (V_{CM}), relative to the supply voltage (V_S). V_{CM} is expressed as (V_{IN+} + V_{IN-}) / 2; however, in practice, V_{CM} is seen as the voltage at V_{IN+} because the voltage drop across V_{SENSE} is typically small.

This section addresses the accuracy of these specific operating regions:

- Normal Case 1: V_{SENSE} ≥ 20 mV, V_{CM} ≥ V_S
- Normal Case 2: V_{SENSE} ≥ 20 mV, V_{CM} < V_S
- Low V_{SENSE} Case 1: V_{SENSE} < 20 mV, –16 V ≤ V_{CM} < 0
- Low V_{SENSE} Case 2: V_{SENSE} < 20 mV, 0 V ≤ V_{CM} ≤ V_S
- Low V_{SENSE} Case 3: V_{SENSE} < 20 mV, V_S < V_{CM} ≤ 80 V

7.4.2.1 Normal Case 1: V_{SENSE} ≥ 20 mV, V_{CM} ≥ V_S

This region of operation provides the highest accuracy. Here, the input offset voltage is characterized and measured using a two-step method. First, the gain is determined by [Equation 2](#).

$$G = \frac{V_{\text{OUT1}} - V_{\text{OUT2}}}{100\text{mV} - 20\text{mV}}$$

where

- V_{OUT1} = output voltage with V_{SENSE} = 100 mV
 - V_{OUT2} = output voltage with V_{SENSE} = 20 mV
- (2)

Then the offset voltage is measured at V_{SENSE} = 100 mV, and referred to the input (RTI) of the current shunt monitor, as shown in [Electrical Characteristics: Current-Shunt Monitor](#).

$$V_{\text{OSRTI}} (\text{Referred-To-Input}) = \left(\frac{V_{\text{OUT1}}}{G} \right) - 100\text{mV} \quad (3)$$

In the [Typical Characteristics](#), [Figure 7](#) shows the highest accuracy for the this region of operation. In this plot, V_S = 12 V. For V_{CM} ≥ 12 V, the output error is at the minimum value. This case creates the V_{SENSE} ≥ 20-mV output specifications in [Electrical Characteristics: Current-Shunt Monitor](#).

Device Functional Modes (continued)

7.4.2.2 Normal Case 2: $V_{SENSE} \geq 20\text{ mV}$, $V_{CM} < V_S$

This region of operation is less accurate than normal case 1 as a result of the common-mode operating area in which the part functions, as shown in the [Figure 7](#) curve ([Figure 7](#)). As noted, for this graph $V_S = 12\text{ V}$; for $V_{CM} < 12\text{ V}$, the output error increases as V_{CM} decreases to less than 12 V , with a typical maximum error of 0.005% at the most negative $V_{CM} = -16\text{ V}$.

7.4.2.3 Low V_{SENSE} Case 1: $V_{SENSE} < 20\text{ mV}$, $-16\text{ V} \leq V_{CM} < 0$ and Low V_{SENSE} Case 3: $V_{SENSE} < 20\text{ mV}$, $V_S < V_{CM} \leq 80\text{ V}$

Although the INA200 family of devices are not designed for accurate operation in these regions, some applications are exposed to these conditions. For example, when monitoring power supplies that are switched on and off while V_S is still applied to the INA20x devices, it is important to know what the behavior of the devices is in these regions.

As V_{SENSE} approaches 0 mV , in these V_{CM} regions, the accuracy of the device output degrades. A larger-than-normal offset can appear at the current shunt monitor output with a typical maximum value of $V_{OUT} = 300\text{ mV}$ for $V_{SENSE} = 0\text{ mV}$. As V_{SENSE} approaches 20 mV , V_{OUT} returns to the expected output value with accuracy as shown in [Electrical Characteristics: Current-Shunt Monitor. Figure 32](#) shows this effect using the INA202 (gain = 100).

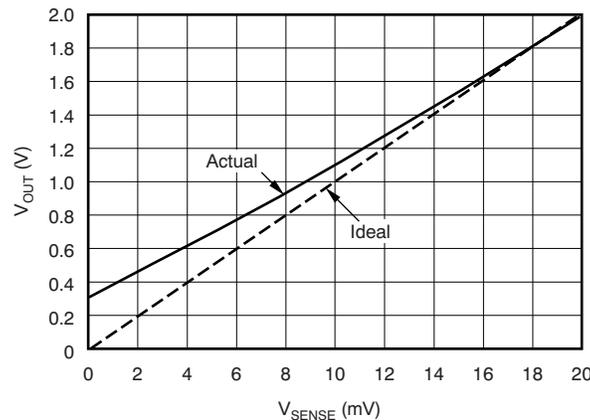

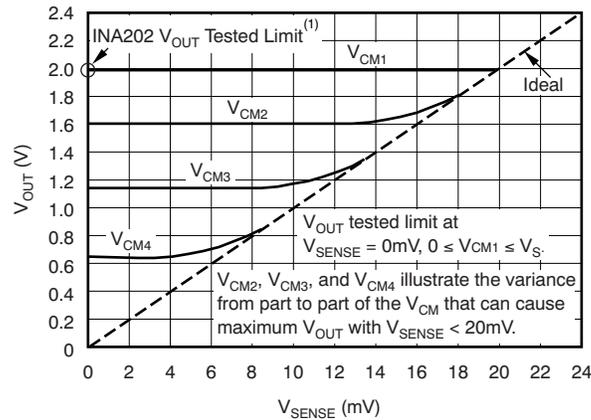

Figure 32. Example For Low V_{SENSE} Cases 1 and 3 (INA202, Gain = 100)

7.4.2.4 Low V_{SENSE} Case 2: $V_{SENSE} < 20\text{ mV}$, $0\text{ V} \leq V_{CM} \leq V_S$

This region of operation is the least accurate for the INA20x family. To achieve the wide input common-mode voltage range, these devices use two op amp front ends in parallel. One op amp front end operates in the positive input common-mode voltage range, and the other in the negative input region. For this case, neither of these two internal amplifiers dominates and overall loop gain is low. Within this region, V_{OUT} approaches voltages close to linear operation levels for normal case 2. This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V . Within this region, as V_{SENSE} approaches 20 mV , device operation is closer to that is described in normal case 2. [Figure 33](#) shows this behavior for the INA202. The V_{OUT} maximum peak for this case is tested by maintaining a constant V_S , setting V_{SENSE} equal to 0 mV and sweeping V_{CM} from 0 V to V_S . The exact V_{CM} at which V_{OUT} peaks during this test varies from device to device, but the V_{OUT} maximum peak is tested to be less than the specified V_{OUT} tested limit.

Device Functional Modes (continued)

NOTE: (1) INA200 V_{OUT} Tested Limit = 0.4V. INA201 V_{OUT} Tested Limit = 1V.

Figure 33. Example For Low V_{SENSE} Case 2 (INA202, Gain = 100)

7.4.3 Transient Protection

The -16 to 80 V common-mode range of the INA20x devices is ideal for withstanding automotive fault conditions ranging from 12-V battery reversal up to 80-V transients, since no additional protective components are required up to those levels. In the event that the INA20x devices are exposed to transients on the inputs in excess of their ratings, then external transient absorption with semiconductor transient absorbers (such as Zeners) are required. TI does not recommend using MOVs or VDRs, except when they are used in addition to a semiconductor transient absorber. Select the transient absorber so the absorber does not allow the INA20x devices to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance and additional voltage due to transient absorber dynamic impedance). Despite the use of internal Zener-type ESD protection, the INA20x devices do not lend themselves to using external resistors in series with the inputs since the internal gain resistors can vary up to $\pm 30\%$. (If gain accuracy is not important, then resistors can be added in series with the INA200, INA201, and INA202 inputs with two equal resistors on each input.)

7.4.4 Output Voltage Range

The output of the INA20x devices is accurate within the output voltage swing range set by the power supply pin (V_S .) This performance is best illustrated when using the INA202 (a gain of 100 version), where a 100-mV full-scale input from the shunt resistor requires an output voltage swing of 10 V, and a power-supply voltage sufficient to achieve 10 V on the output.

8 Application and Implementation

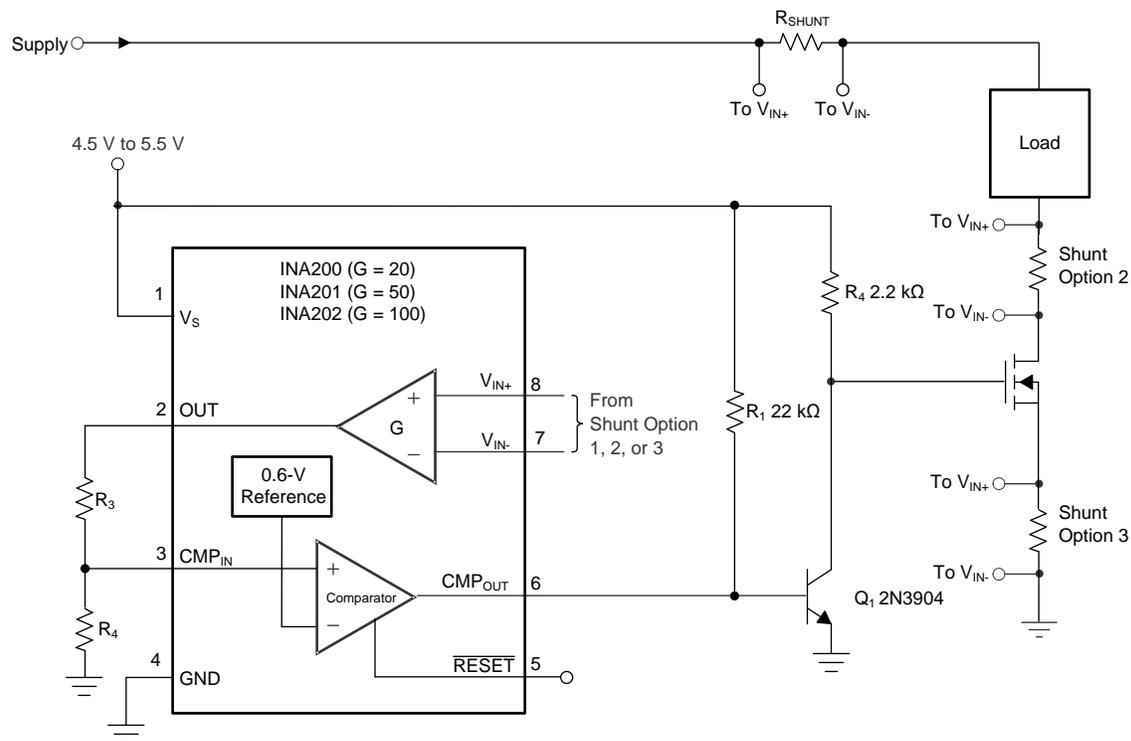

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The INA20x series is designed to enable simple configuration for detecting overcurrent conditions and current monitoring in an application. This device is individually targeted towards overcurrent detection of a single threshold. However, this device can pair with additional devices and circuitry to create more complex monitoring functional blocks.

8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

(1) In this case, Q inverts the comparator output.

Figure 34. Low-Side Switch Overcurrent Shutdown

8.2.1 Design Requirements

The device measures current through a resistive shunt with current flowing in one direction that enables detection of an overcurrent event only when the differential input voltage exceeds the threshold limit. When the current reaches the set limit of the divider R_1 / R_2 , the output of CMP_{OUT} transitions high, which turns Q1 on, pulls the gate of the pass-FET low, and turns off the flow of current.

Typical Application (continued)

8.2.2 Detailed Design Procedure

Figure 34 shows the basic connections of the device. The input terminals (IN+ and IN –) must be connected as closely as possible to the current-sensing resistor to minimize any resistance in series with the shunt resistance. Additional resistance between the current-sensing resistor and input terminals results in errors in the measurement. When input current flows through this external input resistance, the voltage developed across the shunt resistor differs from the voltage reaching the input terminals.

Use the gain of the INA20x and shunt value to calculate the OUT voltage for the desired trip current. Configure R1 and R2 so that the current trip point is equal to the 0.6-V reference voltage.

8.2.3 Application Curve

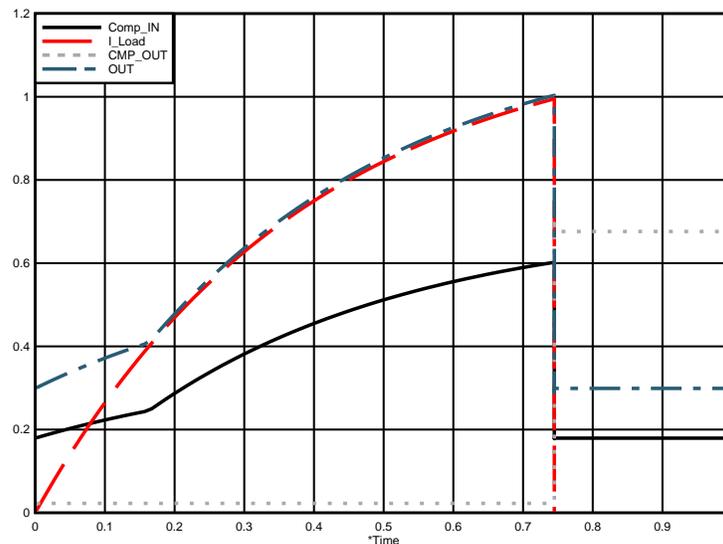

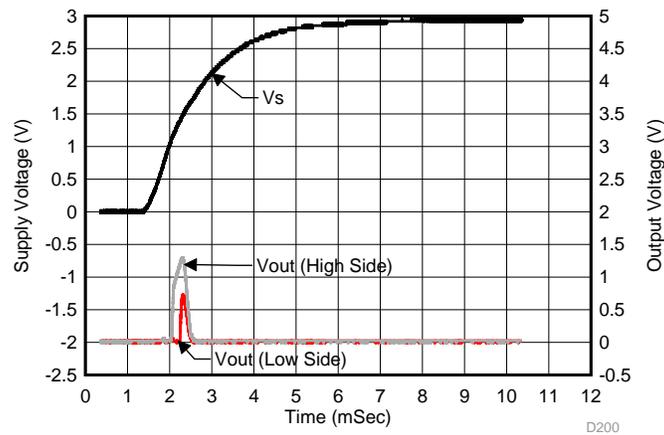

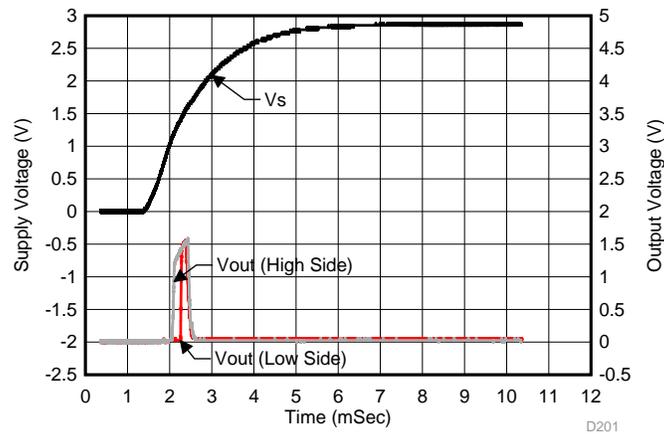

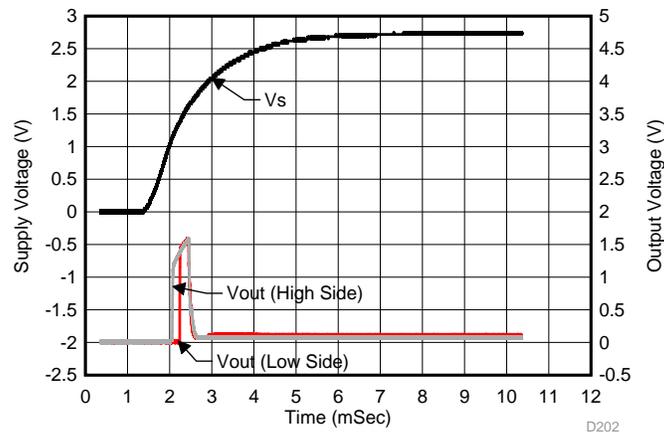

Figure 35. Low-Side Switch Overcurrent Shutdown Response

9 Power Supply Recommendations

The input circuitry of the INA20x devices can accurately measure beyond the power-supply voltage, V_s . For example, the V_s power supply is 5 V, whereas the load power-supply voltage is up to 80 V. However, the output voltage range of the OUT pin is limited by the voltages on the power supply pin.

9.1 Output vs Supply Ramp Considerations

Figure 36, Figure 37, and Figure 38 show the typical output voltages for high and low-side configurations with the given ramp supply voltage. These fluctuations on the output during power-up may require a controller to incorporate a blanking time to disregard the artifacts.

Output vs Supply Ramp Considerations (continued)

Figure 36. Analog Output vs Supply Ramp (INA200)

Figure 37. Analog Output vs Supply Ramp (INA201)

Figure 38. Analog Output vs Supply Ramp (INA202)

10 Layout

10.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very-low-ohmic value of the current resistor, any additional high-current carrying impedance causes significant measurement errors.
- The power-supply bypass capacitor must be placed as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

10.2 Layout Example

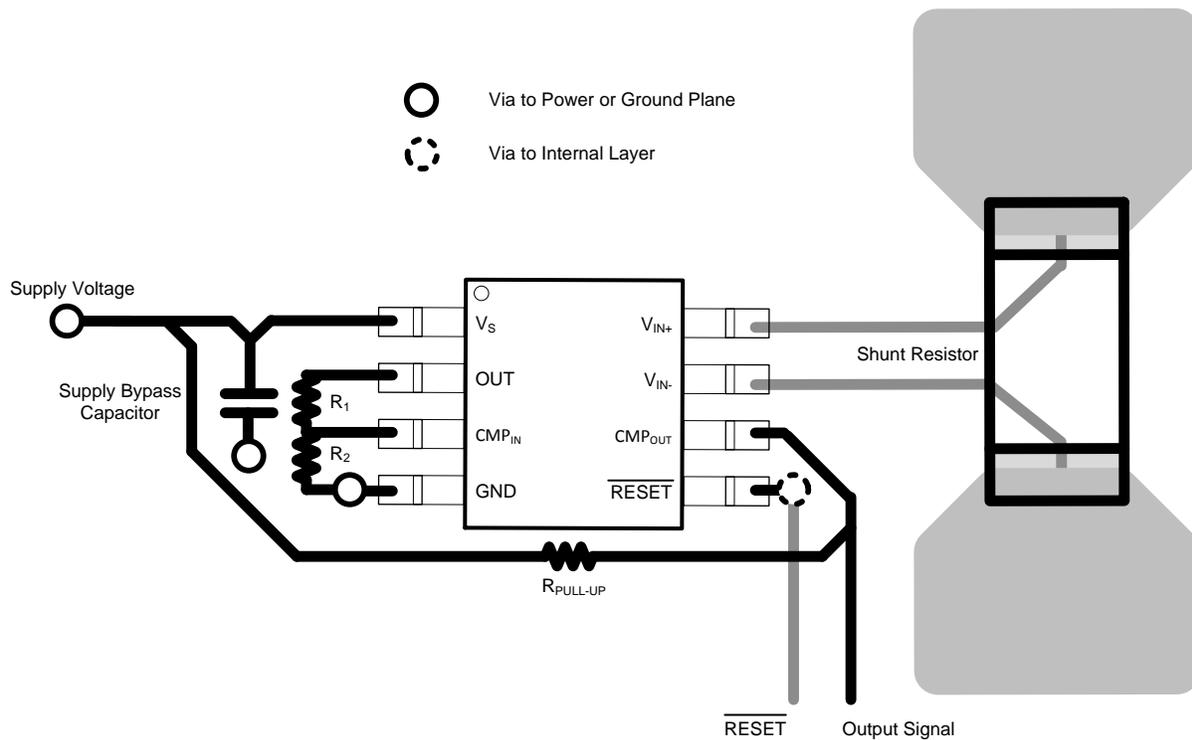

Figure 39. INA20x Layout Example

11 Device and Documentation Support

11.1 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

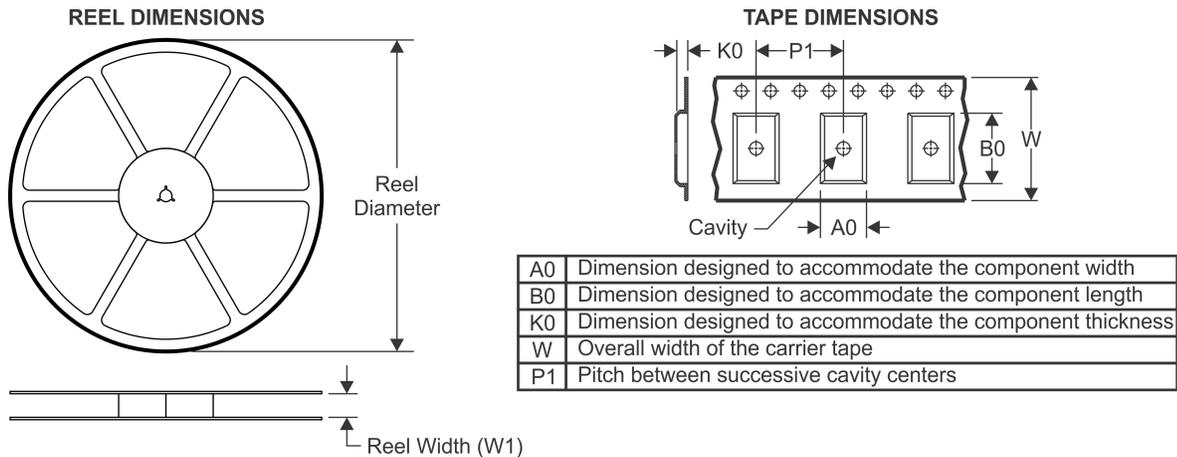

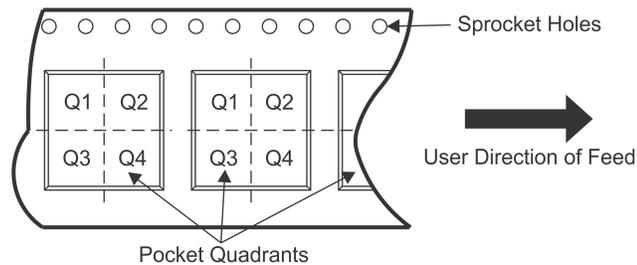

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
